# BIVARIANT AND EXTENDED SYLVESTER RANK FUNCTIONS 

HANFENG LI

#### Abstract

For a unital ring $R$, a Sylvester rank function is a numerical invariant which can be described in three equivalent ways: on finitely presented left $R$ modules, or on rectangular matrices over $R$, or on maps between finitely generated projective left $R$-modules. We extend each Sylvester rank function to all pairs of left $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$, and to all maps between left $R$-modules satisfying suitable properties including continuity and additivity.

As an application, we show that for any epimorphism $R \rightarrow S$ of unital rings, the pull-back map from the set of Sylvester rank functions of $S$ to that of $R$ is injective. We also give a new proof of Schofield's result describing the image of this map when $S$ is the universal localization of $R$ inverting a set of maps between finitely generated projective left $R$-modules.

## 1. Introduction

For a unital ring $R$, a Sylvester rank function for $R$ is a numerical invariant describing the size of finitely presented left $R$-modules. It can be defined in three equivalent ways, all taking values in $\mathbb{R}_{\geq 0}$, on either finitely presented left $R$-modules, or rectangular matrices over $R$, or maps between finitely generated projective left $R$ modules (see Section 2 for the definitions). It was introduced first by Malcolmson in [22] in the first two approaches, and then by Schofield in [28] in the third approach.

Sylvester rank functions arise in many different fields. For a unital $C^{*}$-algebra $R$, given a tracial state $\tau$ for $R$, one can extend $\tau$ to $M_{n}(R)$ for all $n \in \mathbb{N}$ by setting $\tau(A)=\sum_{j=1}^{n} \tau\left(A_{j j}\right)$ for $A \in M_{n}(R)$, and then define $\operatorname{rk}_{\tau}(B)=\lim _{k \rightarrow \infty} \tau\left(|B|^{1 / k}\right)$ for all $B \in M_{n, m}(R)$. The function $\mathrm{rk}_{\tau}$ is a Sylvester rank function defined on rectangular matrices over $R$. This rank function is widely studied in Elliott's classification program for simple nuclear $C^{*}$-algebras, and is fundamental in the definition of strict comparison property and hence in the formulation of the Toms-Winter conjecture $[5,6,8,32]$.

For a discrete group $\Gamma$, if we take $R$ to be the group von Neumann algebra $\mathcal{L} \Gamma$, which consists of bounded linear operators on $\ell^{2}(\Gamma)$ commuting with the right regular representation of $\Gamma$, and take $\tau$ to be the canonical trace given by $\tau(a)=\left\langle a \delta_{e_{\Gamma}}, \delta_{e_{\Gamma}}\right\rangle$, where $\delta_{e_{\Gamma}}$ is the unit vector in $\ell^{2}(\Gamma)$ taking value 1 at the identity element $e_{\Gamma}$ and 0

[^0]everywhere else, then we obtain the von Neumann rank function on $\mathcal{L} \Gamma$. This rank function and its restriction on the group algebra $\mathbb{C} \Gamma$ play a fundamental role in the definition of $L^{2}$-Betti numbers [21].

Systematic study of Sylvester rank functions has also proved useful [1, 9, 10, 12]. Such study is vital in recent work of Jaikin-Zapirain on the Atiyah conjecture and the Lück approximation conjecture [15]. The classical result of Cohn on epimorphisms of $R$ into division rings [7] can be stated as that the isomorphism classes of such homomorphisms are in natural 1-1 correspondence with $\mathbb{Z}_{\geq 0}$-valued Sylvester rank functions on $R$ [22]. This was extended by Schofield to that the equivalence classes of homomorphisms from an algebra $R$ over a field to simple artinian rings, where two such maps are equivalent if the codomains map into a common simple artinian ring $S$ such that the two composition maps from $R$ to $S$ coincide, are in natural 1-1 correspondence with Sylvester rank functions on $R$ taking value in $\frac{1}{n} \mathbb{Z}_{\geq 0}$ for some $n \in \mathbb{N}$ [28, Theorem 7.12].

Sylvester rank functions have been used in the study of direct finiteness. Ara et al. observed in [2] that if $R$ has a Sylvester rank function which is faithful in the sense that every nonzero element of $R$ has positive rank, then $R$ is directly finite in the sense that every one-sided invertible element of $R$ is two-sided invertible. They used this observation to show that the group ring $D \Gamma$ is directly finite for any division ring $D$ and any free-by-amenable group $\Gamma$, which is later extended by Elek and Szabó to all sofic groups [11].

The set of all Sylvester rank functions on $R$ is naturally a compact convex set in a locally convex topological vector space.

Despite the importance of Sylvester rank functions and the nice structure of the set of Sylvester rank functions, in general a Sylvester rank function could have two draw-backs. The first is that it is only defined for finitely presented left $R$-modules or maps between finitely generated projective left $R$-modules. Frequently, we would like it to be defined for all left $R$-modules or maps between all left $R$-modules with suitable properties. The second is that as a measurement of the size of a module, one desirable property for a Sylvester rank function is the additivity, i.e. for any short exact sequence

$$
0 \rightarrow \mathcal{M}_{1} \rightarrow \mathcal{M}_{2} \rightarrow \mathcal{M}_{3} \rightarrow 0
$$

of left $R$-modules, we would like to have that $\operatorname{dim}\left(\mathcal{M}_{2}\right)=\operatorname{dim}\left(\mathcal{M}_{1}\right)+\operatorname{dim}\left(\mathcal{M}_{3}\right)$ if $\operatorname{dim}\left(\mathcal{M}_{j}\right)$ for $j=1,2,3$ are all defined. However, though $\mathbb{Z} \Gamma$ for every discrete group $\Gamma$ has the restriction of the von Neumann rank, whenever $\Gamma$ is nonamenable, there is a short exact sequence of finitely presented left $\mathbb{Z} \Gamma$-modules such that the above additivity fails for every Sylvester rank function of $\mathbb{Z} \Gamma$ (see Example 2.5).

The purpose of this article is to handle these two draw-backs. Given any Sylvester rank function for $R$, we show how to extend it to an invariant for all pairs $\left(\mathcal{M}_{1}, \mathcal{M}_{2}\right)$ of left $R$-modules such that $\mathcal{M}_{1}$ is a submodule of $\mathcal{M}_{2}$ (Definition 3.1 and Theorem 3.3). When $\mathcal{M}_{1}=\mathcal{M}_{2}$ is a finitely presented left $R$-module, we obtain the
original Sylvester rank function. This bivariant Sylvester rank function has two desired properties: continuity and additivity (Definition 3.1 and Theorem 3.4). Furthermore, the extension is unique.

The bivariant Sylvester rank function can also be described equivalently as an invariant for all maps between left $R$-modules (Definition 6.1 and Theorem 6.2). The extended Sylvester rank function on all maps also enjoys continuity and additivity (Definition 6.1). However, the full power of additivity is best exhibited at the module level (Theorem 3.4).

As applications, we apply our construction to study the behaviour of Sylvester rank functions under epimorphisms. Given a unital ring homomorphism $\pi: R \rightarrow S$, one has a natural continuous affine map $\pi^{*}$ from the space of Sylvester rank functions on $S$ to that on $R$. A natural question is when $\pi^{*}$ is surjective or injective. We show that if $\pi$ is an epimorphism, then $\pi^{*}$ is injective (Theorem 8.1). This extends a result of Jaikin-Zapirain in the case $S$ is von Neumann regular. We also describe the image of $\pi^{*}$ (Theorem 8.2). A special case of epimorphism is the map of $R$ to the universal localization ring $R_{\Sigma}$, where $\Sigma$ is a set of maps between finitely generated projective left $R$-modules. In this case we give a new proof of the classical result of Schofield describing the image of $\pi^{*}$ in terms of the rank of elements in $\Sigma$ (Theorem 8.4).

This article is organized as follows. In Section 2 we recall the definitions of Sylvester rank functions. In Section 3 we define the bivariant Sylvester module rank function, and show that each Sylvester module rank function extends uniquely to a bivariant one. The full additivity of the bivariant Sylvester module rank function is also established in this section. Section 4 is devoted to discussing when a bivariant Sylvester module rank function is in fact a length function. The continuity of a bivariant Sylvester module rank function under direct limits is proved in Section 5. In Section 6 we define the extended Sylvester map rank function and show that they are in natural 1-1 correspondence with the bivariant Sylvester module rank functions. We also derive various properties of the extended Sylvester map rank functions from those of the bivariant Sylvester module rank functions. Section 7 is devoted to the study of how an $S$ - $R$-bimodule can be used to induce an extended Sylvester map rank function for $R$ from one for $S$. The applications to epimorphisms are given in Section 8.

Throughout this article, all modules will be left modules unless specified. All maps between modules will be module homomorphisms. For any module $\mathcal{M}$, we denote by $\mathrm{id}_{\mathcal{M}}$ the identity map of $\mathcal{M}$. For a map $\alpha: \mathcal{M}_{1} \rightarrow \mathcal{M}_{2}$ between $R$-modules and an $x \in \mathcal{M}_{1}$, we shall write $(x) \alpha$ instead of $\alpha(x)$ for the image of $x$.
Acknowledgments. This work is partially supported by NSF and NSFC grants. It started while I attended the program on $L^{2}$-invariants at ICMAT in Spring 2018. I am grateful to Andrei Jaikin-Zapirain for inspiring discussions, especially for suggesting that the bivariant Sylvester module rank function might be used to give a new proof of Schofield's Theorem 8.4. I would also like to thank the anonymous referee for very useful comments.

## 2. Sylvester Rank Functions

Let $R$ be a unital ring. We recall the definitions and basic facts about Sylvester rank functions for $R$.

Definition 2.1. A Sylvester module rank function for $R$ is an $\mathbb{R}_{\geq 0}$-valued function dim on the class of all finitely presented $R$-modules such that
(1) $\operatorname{dim}(0)=0, \operatorname{dim}(R)=1$.
(2) $\operatorname{dim}\left(\mathcal{M}_{1} \oplus \mathcal{M}_{2}\right)=\operatorname{dim}\left(\mathcal{M}_{1}\right)+\operatorname{dim}\left(\mathcal{M}_{2}\right)$.
(3) For any exact sequence $\mathcal{M}_{1} \rightarrow \mathcal{M}_{2} \rightarrow \mathcal{M}_{3} \rightarrow 0$, one has

$$
\operatorname{dim}\left(\mathcal{M}_{3}\right) \leq \operatorname{dim}\left(\mathcal{M}_{2}\right) \leq \operatorname{dim}\left(\mathcal{M}_{1}\right)+\operatorname{dim}\left(\mathcal{M}_{3}\right) .
$$

From (3) it is clear that dim is an isomorphism invariant.
Definition 2.2. A Sylvester matrix rank function for $R$ is an $\mathbb{R}_{\geq 0}$-valued function rk on the set of all rectangular matrices over $R$ such that
(1) $\operatorname{rk}(0)=0, \operatorname{rk}(1)=1$.
(2) $\operatorname{rk}(A B) \leq \min (\operatorname{rk}(A), \operatorname{rk}(B))$.
(3) $\operatorname{rk}\left(\left[\begin{array}{ll}A & \\ & B\end{array}\right]\right)=\operatorname{rk}(A)+\operatorname{rk}(B)$.
(4) $\operatorname{rk}\left(\left[\begin{array}{ll}A & C \\ & B\end{array}\right]\right) \geq \operatorname{rk}(A)+\operatorname{rk}(B)$.

The notions of Sylvester module rank functions and Sylvester matrix rank functions were introduced by Malcolmson [22].

Definition 2.3. A Sylvester map rank function for $R$ is an $\mathbb{R}_{\geq 0}$-valued function rk on the class of all maps between finitely generated projective $R$-modules such that
(1) $\operatorname{rk}(0)=0, \operatorname{rk}\left(\mathrm{id}_{R}\right)=1$.
(2) $\operatorname{rk}(\alpha \beta) \leq \min (\operatorname{rk}(\alpha), \operatorname{rk}(\beta))$.
(3) $\operatorname{rk}\left(\left[\begin{array}{ll}\alpha & \\ & \beta\end{array}\right]\right)=\operatorname{rk}(\alpha)+\operatorname{rk}(\beta)$.
(4) $\operatorname{rk}\left(\left[\begin{array}{ll}\alpha & \gamma \\ & \beta\end{array}\right]\right) \geq \operatorname{rk}(\alpha)+\operatorname{rk}(\beta)$.

The notion of Sylvester map rank functions was introduced by Schofield [28, page 97].

Theorem 2.4. There is a natural one-to-one correspondence between Sylvester module rank functions, Sylvester map rank functions, and Sylvester matrix rank functions as follows:
(1) Given a Sylvester module rank function dim, for any map $\alpha: P \rightarrow Q$ between finitely generated projective $R$-modules $P$ and $Q$, define $\operatorname{rk}(\alpha)=\operatorname{dim}(Q)-$ $\operatorname{dim}(\operatorname{coker}(\alpha))$. Then rk is a Sylvester map rank function.
(2) Given a Sylvester map rank function rk, for any $A \in M_{n, m}(R)$, consider the map $\alpha_{A}: R^{n} \rightarrow R^{m}$ sending $x$ to $x A$, and define $\operatorname{rk}^{\prime}(A)=\operatorname{rk}\left(\alpha_{A}\right)$. Then $\mathrm{rk}^{\prime}$ is a Sylvester matrix rank function.
(3) Given a Sylvester matrix rank function rk, for any finitely presented $R$ module $\mathcal{M}$ take some $A \in M_{n, m}(R)$ such that $\mathcal{M} \cong R^{m} / R^{n} A$, and define $\operatorname{dim}(\mathcal{M})=m-\operatorname{rk}(A)$. Then $\operatorname{dim}$ is a Sylvester module rank function.

The correspondence between Sylvester module rank functions and Sylvester matrix rank functions in Theorem 2.4 is in [22, Theorem 4]. The correspondence between Sylvester module rank functions and Sylvester map rank functions in Theorem 2.4 is in [28, page 97].

Example 2.5. Let $\Gamma$ be a discrete group. The group ring $R \Gamma$ [25] consists of finitely supported functions $f: \Gamma \rightarrow R$ which we shall write as $f=\sum_{s \in \Gamma} f_{s} s$, where $f_{s} \in R$ is zero except for finitely many $s \in \Gamma$. The addition and multiplication in $R \Gamma$ are given by

$$
\sum_{s \in \Gamma} f_{s} s+\sum_{s \in \Gamma} g_{s} s=\sum_{s \in \Gamma}\left(f_{s}+g_{s}\right) s, \quad\left(\sum_{s \in \Gamma} f_{s} s\right)\left(\sum_{t \in \Gamma} g_{t} t\right)=\sum_{s, t \in \Gamma} f_{s} g_{t}(s t) .
$$

Now assume that $\Gamma$ is nonamenable, and that $R$ is an integral domain. Denote by $K$ the fractional field of $R$. Then we have the group rings $R \Gamma$ and $K \Gamma$. Bartholdi showed that for some suitable $n \in \mathbb{N}$ there is an injective map $(K \Gamma)^{n+1} \rightarrow(K \Gamma)^{n}$ of $K \Gamma$-modules [3]. Multiplying by a suitable element of $R$, we get an injective map $\alpha:(R \Gamma)^{n+1} \rightarrow(R \Gamma)^{n}$ of $R \Gamma$-modules, and thus an exact sequence

$$
0 \rightarrow(R \Gamma)^{n+1} \xrightarrow{\alpha}(R \Gamma)^{n} \rightarrow \operatorname{coker}(\alpha) \rightarrow 0
$$

of finitely presented $R \Gamma$-modules. For any Sylvester module rank function dim of $R \Gamma$, we have

$$
\operatorname{dim}\left((R \Gamma)^{n}\right)=n<\operatorname{dim}\left((R \Gamma)^{n+1}\right)+\operatorname{dim}(\operatorname{coker}(\alpha))
$$

## 3. Bivariant Sylvester Module Rank Functions

Let $R$ be a unital ring.
Definition 3.1. A bivariant Sylvester module rank function for $R$ is an $\mathbb{R}_{\geq 0} \cup\{+\infty\}$ valued function $\left(\mathcal{M}_{1}, \mathcal{M}_{2}\right) \mapsto \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)$ on the class of all pairs of $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$ satisfying the following conditions:
(1) $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)$ is an isomorphism invariant.
(2) (Normalization) Setting $\operatorname{dim}(\mathcal{M})=\operatorname{dim}(\mathcal{M} \mid \mathcal{M})$ for all $R$-modules $\mathcal{M}$, one has $\operatorname{dim}(0)=0$ and $\operatorname{dim}(R)=1$.
(3) (Direct sum) For any $R$-modules $\mathcal{M}_{3} \subseteq \mathcal{M}_{4}$, one has

$$
\operatorname{dim}\left(\mathcal{M}_{1} \oplus \mathcal{M}_{3} \mid \mathcal{M}_{2} \oplus \mathcal{M}_{4}\right)=\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{3} \mid \mathcal{M}_{4}\right)
$$

(4) (Continuity) $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)=\sup _{\mathcal{M}_{1}^{\prime}} \operatorname{dim}\left(\mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{2}\right)$ for $\mathcal{M}_{1}^{\prime}$ ranging over all finitely generated $R$-submodules of $\mathcal{M}_{1}$.
(5) (Continuity) When $\mathcal{M}_{1}$ is finitely generated, $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)=\inf _{\mathcal{M}_{2}^{\prime}} \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}^{\prime}\right)$ for $\mathcal{M}_{2}^{\prime}$ ranging over all finitely generated $R$-submodules of $\mathcal{M}_{2}$ containing $\mathcal{M}_{1}$.
(6) (Additivity) $\operatorname{dim}\left(\mathcal{M}_{2}\right)=\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}\right)$.

Example 3.2. The first bivariant Sylvester module rank function was constructed in [18] for the group ring $R \Gamma$ of any sofic group $\Gamma$, when a normalized length function L for $R$ (see Definition 4.1 below) is given. We recall the construction here. The group $\Gamma$ is sofic $[13,26,31]$ if there is a collection of maps $\Sigma=\left\{\sigma_{j}: j \in J\right\}$ over a directed set $J$ with each $\sigma_{j}$ being a map (not necessarily a group homomorphism) from $\Gamma$ to the permutation group of a nonempty finite set $X_{j}$ such that
(1) for any $s, t \in \Gamma$, one has $\lim _{j \rightarrow \infty} \frac{1}{\left|X_{j}\right|}\left|\left\{x \in X_{j}: \sigma_{j, s} \sigma_{j, t}(x)=\sigma_{j, s t}(x)\right\}\right|=1$,
(2) for any distinct $s, t \in \Gamma$, one has $\lim _{j \rightarrow \infty} \frac{1}{\left|X_{j}\right|}\left|\left\{x \in X_{j}: \sigma_{j, s}(x) \neq \sigma_{j, t}(x)\right\}\right|=$ 1,
(3) $\lim _{j \rightarrow \infty}\left|X_{j}\right|=\infty$.

Fix $\Sigma$ and fix an ultrafilter $\omega$ on $J$ such that $\omega$ is free in the sense that for any $j \in J$, the set $\{i \in J: i \geq j\}$ is in $\omega$. Let $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$ be $R \Gamma$-modules. Denote by $\mathcal{F}(\Gamma)$ the set of all finite subsets of $\Gamma$, and by $\mathscr{F}(\mathcal{M})$ the set of finitely generated $R$-submodules of any $R \Gamma$-module $\mathcal{M}$. For any $F \in \mathscr{F}(\Gamma), \mathscr{A} \in \mathscr{F}\left(\mathcal{M}_{1}\right), \mathscr{B} \in \mathscr{F}\left(\mathcal{M}_{2}\right)$, and $j \in J$, denote by $\mathscr{M}\left(\mathscr{B}, F, \sigma_{j}\right)$ the $R$-submodule of $\mathcal{M}_{2}^{X_{j}}$ generated by $\delta_{x} b-\delta_{\sigma_{j, s}(x)}(s b)$ for all $x \in X_{j}, s \in F$ and $b \in \mathscr{B}$, and denote by $\mathscr{M}\left(\mathscr{A}, \mathscr{B}, F, \sigma_{j}\right)$ the image of $\mathscr{A}^{X_{j}}$ under the quotient map $\mathcal{M}_{2}^{X_{j}} \rightarrow \mathcal{M}_{2}^{X_{j}} / \mathscr{M}\left(\mathscr{B}, F, \sigma_{j}\right)$. Define [18, Definition 3.1]

$$
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right):=\sup _{\mathscr{A} \in \mathscr{F}\left(\mathcal{M}_{1}\right)} \inf _{\mathscr{B} \in \mathscr{F}\left(\mathcal{M}_{2}\right)} \inf _{F \in \mathcal{F}(\Gamma)} \lim _{j \rightarrow \omega} \frac{\mathrm{~L}\left(\mathscr{M}\left(\mathscr{A}, \mathscr{B}, F, \sigma_{j}\right)\right)}{\left|X_{j}\right|}
$$

Then $\operatorname{dim}(\cdot \mid \cdot)$ is a bivariant Sylvester module rank function for $R \Gamma[18$, Theorem 1.1, Corollary 3.2, Proposition 3.4, Proposition 3.5]. For connections of this bivariant Sylvester module rank function to dynamical invariants mean dimension and entropy, see $[18,19]$. If $s \in \Gamma$ has infinite order, then $\operatorname{dim}(R \Gamma(s-1) \mid R \Gamma)=1$ and $\operatorname{dim}(R \Gamma / R \Gamma(s-1))=0$ [18, Example 6.3]. In particular, when $\Gamma$ is the free group $\mathbb{F}_{2}$ with two generators $s$ and $t, R \mathbb{F}_{2}$ has a free $R \Gamma$-submodule with generators $s-1$ and $t-1$ [25, Corollary 10.3.7.(iv)], and hence $R \mathbb{F}_{2} / R \mathbb{F}_{2}(s-1)$ contains an $R \mathbb{F}_{2}$-submodule isomorphic to $R \mathbb{F}_{2}$ while $\operatorname{dim}\left(R \mathbb{F}_{2} / R \mathbb{F}_{2}(s-1)\right)=0$.

For any bivariant Sylvester module rank function $\operatorname{dim}(\cdot \mid \cdot)$ for $R$, clearly $\mathcal{M} \mapsto$ $\operatorname{dim}(\mathcal{M})$ for finitely presented $R$-modules $\mathcal{M}$ is a Sylvester module rank function for $R$.

The goal of this section is to prove the following two results.
Theorem 3.3. Every Sylvester module rank function for $R$ extends uniquely to a bivariant Sylvester module rank function for $R$.

Theorem 3.4. For any bivariant Sylvester module rank function $\operatorname{dim}(\cdot \mid \cdot)$ for $R$ and any $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{2} \subseteq \mathcal{M}_{3}$, we have

$$
\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right)=\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{3} / \mathcal{M}_{1}\right)
$$

From [18, Lemma 7.7] we have the following lemma, which gives the uniqueness part of Theorem 3.3.

Lemma 3.5. Let $\operatorname{dim}_{1}(\cdot \mid \cdot)$ and $\operatorname{dim}_{2}(\cdot \mid \cdot)$ be bivariant Sylvester module rank functions for $R$. If $\operatorname{dim}_{1}(\mathcal{M})=\operatorname{dim}_{2}(\mathcal{M})$ for all finitely presented $R$-modules $\mathcal{M}$, then $\operatorname{dim}_{1}=$ $\operatorname{dim}_{2}$.

Let $\operatorname{dim}(\cdot)$ be a Sylvester module rank function for $R$. We shall extend it step by step to a bivariant Sylvester module rank function for $R$.

Lemma 3.6. Let $\mathcal{M}_{1}$ and $\mathcal{M}_{2}$ be finitely presented $R$-modules such that $\mathcal{M}_{1}$ is a quotient module of $\mathcal{M}_{2}$. Then $\operatorname{dim}\left(\mathcal{M}_{2}\right) \geq \operatorname{dim}\left(\mathcal{M}_{1}\right)$.

Proof. Let $\alpha: \mathcal{M}_{2} \rightarrow \mathcal{M}_{1}$ be a surjective map. Then $\operatorname{ker}(\alpha)$ is finitely generated [16, Proposition 4.26]. Thus we have an exact sequence

$$
R^{n} \rightarrow \mathcal{M}_{2} \rightarrow \mathcal{M}_{1} \rightarrow 0
$$

of finitely presented $R$-modules for some suitable $n \in \mathbb{N}$. Therefore $\operatorname{dim}\left(\mathcal{M}_{2}\right) \geq$ $\operatorname{dim}\left(\mathcal{M}_{1}\right)$.

The following lemma is [22, Lemma 2], which is a strengthened version of Schanuel's lemma.

Lemma 3.7. Let $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$ and $\mathcal{M}_{3} \subseteq \mathcal{M}_{4}$ be $R$-modules such that $\mathcal{N}_{2}, \mathcal{M}_{4}$ are projective and $\mathcal{M}_{2} / \mathcal{M}_{1} \cong \mathcal{M}_{4} / \mathcal{M}_{3}$. Then there is an isomorphism $\alpha: \mathcal{M}_{2} \oplus \mathcal{M}_{4} \rightarrow$ $\mathcal{M}_{2} \oplus \mathcal{M}_{4}$ such that $\left(\mathcal{N}_{1} \oplus \mathcal{M}_{4}\right) \alpha=\mathcal{M}_{2} \oplus \mathcal{M}_{3}$.

Lemma 3.8. Let $\mathcal{M}$ be a finitely generated $R$-module. Write $\mathcal{M}$ as $\mathcal{N}_{2} / \mathcal{M}_{1}$ for some finitely generated projective $R$-module $\mathcal{M}_{2}$ and some $R$-submodule $\mathcal{N}_{1}$ of $\mathcal{N}_{2}$. Then $\inf _{\mathcal{M}_{1}^{\prime}} \operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime}\right)$, where $\mathcal{M}_{1}^{\prime}$ runs over finitely generated $R$-submodules of $\mathcal{M}_{1}$, does not depend on the choice of the representation of $\mathcal{M}$ as $\mathcal{M}_{2} / \mathcal{M}_{1}$. Thus $\operatorname{dim}(\mathcal{M}):=\inf _{\mathcal{M}_{1}^{\prime}} \operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime}\right)=\lim _{\mathcal{M}_{1}^{\prime}} \mathcal{M}_{1} \operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime}\right)$ (where the set of finitely generated $R$-submodules of $\mathcal{M}_{1}$ is ordered by inclusion) is well defined, is equal to $\inf _{\mathcal{M}^{\prime}} \operatorname{dim}\left(\mathcal{M}^{\prime}\right)$ for $\mathcal{M}^{\prime}$ ranging over all finitely presented $R$-modules which admit $\mathcal{M}$ as a quotient module, and extends dim for finitely presented $R$-modules.

Proof. Note first that if $\mathcal{M}_{1}^{\prime} \subseteq \mathcal{M}_{1}^{\prime \prime}$ are finitely generated $R$-submodules of $\mathcal{M}_{1}$, then $\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime}$ and $\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime \prime}$ are finitely presented $R$-modules and $\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime \prime}$ is a quotient module of $\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime}$. Thus by Lemma 3.6 we have $\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime}\right) \geq \operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime \prime}\right)$.

Suppose that we also have $\mathcal{M}=\mathcal{M}_{4} / \mathcal{M}_{3}$ for some finitely generated projective $R$ module $\mathcal{M}_{4}$. By Lemma 3.7 we have an isomorphism $\alpha: \mathcal{M}_{2} \oplus \mathcal{M}_{4} \rightarrow \mathcal{M}_{2} \oplus \mathcal{M}_{4}$ such
that $\left(\mathcal{M}_{1} \oplus \mathcal{M}_{4}\right) \alpha=\mathcal{M}_{2} \oplus \mathcal{M}_{3}$. Let $\mathcal{M}_{1}^{\prime}$ and $\mathcal{M}_{3}^{\prime}$ be finitely generated $R$-submodules of $\mathcal{M}_{1}$ and $\mathcal{M}_{3}$ respectively. Then

$$
\left(\mathcal{M}_{1}^{\prime} \oplus \mathcal{M}_{4}\right)+\left(\mathcal{M}_{2} \oplus \mathcal{M}_{3}^{\prime}\right) \alpha^{-1}=\mathcal{M}_{1}^{\prime \prime} \oplus \mathcal{M}_{4}
$$

for some finitely generated $R$-submodule $\mathcal{M}_{1}^{\prime \prime}$ of $\mathcal{M}_{2}$. Since $\mathcal{M}_{1}^{\prime} \oplus \mathcal{M}_{4} \subseteq \mathcal{N}_{1}^{\prime \prime} \oplus \mathcal{M}_{4} \subseteq$ $\mathcal{M}_{1} \oplus \mathcal{M}_{4}$, we have $\mathcal{M}_{1}^{\prime} \subseteq \mathcal{M}_{1}^{\prime \prime} \subseteq \mathcal{M}_{1}$. Similarly, we have

$$
\left(\mathcal{M}_{1}^{\prime} \oplus \mathcal{M}_{4}\right) \alpha+\left(\mathcal{M}_{2} \oplus \mathcal{M}_{3}^{\prime}\right)=\mathcal{M}_{2} \oplus \mathcal{M}_{3}^{\prime \prime}
$$

for some finitely generated $R$-submodule $\mathcal{N}_{3}^{\prime \prime}$ of $\mathcal{M}_{3}$ containing $\mathcal{N}_{3}^{\prime}$. Clearly ( $\mathcal{N}_{1}^{\prime \prime} \oplus$ $\left.\mathcal{M}_{4}\right) \alpha=\mathcal{M}_{2} \oplus \mathcal{M}_{3}^{\prime \prime}$. Therefore $\alpha$ induces an isomorphism $\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime \prime} \rightarrow \mathcal{M}_{4} / \mathcal{N}_{3}^{\prime \prime}$. From the first paragraph of the proof we then have $\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime}\right) \geq \operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime \prime}\right)=$ $\operatorname{dim}\left(\mathcal{M}_{4} / \mathcal{M}_{3}^{\prime \prime}\right)$ and $\operatorname{dim}\left(\mathcal{M}_{4} / \mathcal{M}_{3}^{\prime}\right) \geq \operatorname{dim}\left(\mathcal{M}_{4} / \mathcal{M}_{3}^{\prime \prime}\right)=\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime \prime}\right)$. It follows that $\inf _{\mathcal{M}_{1}^{\prime}} \operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime}\right)=\inf _{\mathcal{M}_{3}^{\prime}} \operatorname{dim}\left(\mathcal{M}_{4} / \mathcal{M}_{3}^{\prime}\right)$.

Now it is straightforward to prove the rest of the statements of the lemma.
The following lemma is obvious.
Lemma 3.9. Let $\mathcal{M}$ be a finitely generated $R$-module and let $\mathcal{N}^{\prime}$ be a quotient module of $\mathcal{M}$. Then $\operatorname{dim}(\mathcal{M}) \geq \operatorname{dim}\left(\mathcal{M}^{\prime}\right)$.

For any finitely generated $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$, we define

$$
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right):=\operatorname{dim}\left(\mathcal{M}_{2}\right)-\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}\right) \geq 0 .
$$

Lemma 3.10. Let $\mathcal{M}_{1} \subseteq \mathcal{M}_{2} \subseteq \mathcal{M}_{3}$ be finitely generated $R$-modules. Then

$$
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right) \geq \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)
$$

Proof. Take finitely generated free $R$-modules $\mathcal{N}_{2} \subseteq \mathcal{N}_{3}$ and a surjective map $\alpha$ : $\mathcal{N}_{3} \rightarrow \mathcal{M}_{3}$ with $\left(\mathcal{N}_{2}\right) \alpha=\mathcal{M}_{2}$. Denote by $\mathcal{N}_{1}$ the preimage of $\mathcal{M}_{1}$ in $\mathcal{N}_{3}$. Note that $\mathcal{N}_{1}=\operatorname{ker}(\alpha)+\left(\mathcal{N}_{1} \cap \mathcal{N}_{2}\right)$.

Let $\varepsilon>0$. Take finitely generated $R$-submodules $\mathcal{N}_{1}^{\prime}$ and $\mathcal{W}_{2}$ of $\mathcal{N}_{1}$ and $\operatorname{ker}(\alpha) \cap \mathcal{N}_{2}$ respectively such that

$$
\operatorname{dim}\left(\mathcal{N}_{3} / \mathcal{N}_{1}^{\prime}\right)-\operatorname{dim}\left(\mathcal{M}_{3} / \mathcal{M}_{1}\right), \operatorname{dim}\left(\mathcal{N}_{2} / \mathcal{W}_{2}\right)-\operatorname{dim}\left(\mathcal{M}_{2}\right)<\varepsilon .
$$

Since $\mathcal{N}_{1}=\operatorname{ker}(\alpha)+\left(\mathcal{N}_{1} \cap \mathcal{N}_{2}\right)$, enlarging $\mathcal{N}_{1}^{\prime}$ if necessary, we may assume that $\mathcal{N}_{1}^{\prime}=\mathcal{W}+\mathcal{N}_{12}^{\prime}$ for some finitely generated $R$-submodules $\mathcal{W}$ and $\mathcal{N}_{12}^{\prime}$ of $\operatorname{ker}(\alpha)$ and $\mathcal{N}_{1} \cap \mathcal{N}_{2}$ respectively such that $\mathcal{W}_{2} \subseteq \mathcal{W}, \mathcal{N}_{12}^{\prime}$.

Consider the surjective map $\beta: \mathcal{N}_{3} / \mathcal{W} \oplus \mathcal{N}_{2} / \mathcal{N}_{12}^{\prime} \rightarrow \mathcal{N}_{3} / \mathcal{N}_{1}^{\prime}$ sending $\left(x+\mathcal{W}, y+\mathcal{N}_{12}^{\prime}\right)$ to $x-y+\mathcal{N}_{1}^{\prime}$. Also consider the map $\gamma: \mathcal{N}_{2} / \mathcal{W}_{2} \rightarrow \mathcal{N}_{3} / \mathcal{W} \oplus \mathcal{N}_{2} / \mathcal{N}_{12}^{\prime}$ sending $z+\mathcal{W}_{2}$ to $\left(z+\mathcal{W}, z+\mathcal{N}_{12}^{\prime}\right)$. Clearly $\gamma \beta=0$. Since $\mathcal{W}+\mathcal{N}_{12}^{\prime}=\mathcal{N}_{1}^{\prime}$, it is easy to see that the sequence

$$
\mathcal{N}_{2} / \mathcal{W}_{2} \xrightarrow{\gamma} \mathcal{N}_{3} / \mathcal{W} \oplus \mathcal{N}_{2} / \mathcal{N}_{12}^{\prime} \xrightarrow{\beta} \mathcal{N}_{3} / \mathcal{N}_{1}^{\prime} \rightarrow 0
$$

of finitely presented $R$-modules is exact. Thus

$$
\operatorname{dim}\left(\mathcal{M}_{3}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}\right) \leq \operatorname{dim}\left(\mathcal{N}_{3} / \mathcal{W}\right)+\operatorname{dim}\left(\mathcal{N}_{2} / \mathcal{N}_{12}^{\prime}\right)
$$

$$
\begin{aligned}
& =\operatorname{dim}\left(\mathcal{N}_{3} / \mathcal{W} \oplus \mathcal{N}_{2} / \mathcal{N}_{12}^{\prime}\right) \\
& \leq \operatorname{dim}\left(\mathcal{N}_{2} / \mathcal{W}_{2}\right)+\operatorname{dim}\left(\mathcal{N}_{3} / \mathcal{N}_{1}^{\prime}\right) \\
& \leq \operatorname{dim}\left(\mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{3} / \mathcal{M}_{1}\right)+2 \varepsilon
\end{aligned}
$$

It follows that

$$
\operatorname{dim}\left(\mathcal{M}_{3}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}\right) \leq \operatorname{dim}\left(\mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{3} / \mathcal{M}_{1}\right)
$$

and hence $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right) \leq \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)$.
Let $\mathcal{M}_{2}$ be an $R$-module and $\mathcal{M}_{1}$ a finitely generated $R$-submodule of $\mathcal{M}_{2}$. We define

$$
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right):=\inf _{\mathcal{M}_{2}^{\prime}} \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}^{\prime}\right)=\lim _{\mathcal{M}_{2}^{\prime} \nearrow \mathcal{M}_{2}} \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}^{\prime}\right)
$$

for $\mathcal{M}_{2}^{\prime}$ ranging over finitely generated $R$-submodules of $\mathcal{M}_{2}$ containing $\mathcal{M}_{1}$ ordered by inclusion. By Lemma 3.10 it coincides with the earlier definition when both $\mathcal{M}_{1}$ and $\mathcal{M}_{2}$ are finitely generated. The following lemma is a direct consequence of Lemma 3.9.

Lemma 3.11. Let $\mathcal{M}_{1} \subseteq \mathcal{M}_{2} \subseteq \mathcal{M}_{3}$ be $R$-modules such that $\mathcal{M}_{1}$ and $\mathcal{M}_{2}$ are finitely generated. Then $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right) \leq \operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right)$.

Let $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$ be $R$-modules. We define

$$
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right):=\sup _{\mathcal{M}_{1}^{\prime}} \operatorname{dim}\left(\mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{2}\right)=\lim _{\mathcal{M}_{1}^{\prime} \not \mathcal{M}_{1}} \operatorname{dim}\left(\mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{2}\right)
$$

for $\mathcal{M}_{1}^{\prime}$ ranging over finitely generated $R$-submodules of $\mathcal{M}_{1}$ ordered by inclusion. By Lemma 3.11 this extends the earlier definition when $\mathcal{M}_{1}$ is finitely generated. We also define

$$
\operatorname{dim}(\mathcal{M}):=\operatorname{dim}(\mathcal{M} \mid \mathcal{M})
$$

for all $R$-modules $\mathcal{M}$. It coincides with the earlier definition when $\mathcal{M}$ is finitely generated.

Lemma 3.12. Let $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$ and $\mathcal{M}_{3} \subseteq \mathcal{M}_{4}$ be $R$-modules. Then

$$
\operatorname{dim}\left(\mathcal{M}_{1} \oplus \mathcal{M}_{3} \mid \mathcal{M}_{2} \oplus \mathcal{M}_{4}\right)=\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{3} \mid \mathcal{M}_{4}\right) .
$$

Proof. Let $\mathcal{M}_{1}^{\sharp}$ and $\mathcal{M}_{2}^{\sharp}$ be finitely generated $R$-modules. For $j=1,2$, write $\mathcal{M}_{j}^{\sharp}$ as $\mathcal{N}_{j}^{b} / \mathcal{M}_{j}^{*}$ for some finitely generated free $R$-module $\mathcal{N}_{j}^{b}$ and some $R$-submodule $\mathcal{N}_{j}^{*}$ of $\mathcal{M}_{j}^{b}$. Then $\mathcal{M}_{1}^{\sharp} \oplus \mathcal{M}_{2}^{\sharp}$ is isomorphic to $\left(\mathcal{N}_{1}^{b} \oplus \mathcal{N}_{2}^{b}\right) /\left(\mathcal{N}_{1}^{*} \oplus \mathcal{M}_{2}^{*}\right)$. We have

$$
\begin{align*}
\operatorname{dim}\left(\mathcal{M}_{1}^{\sharp} \oplus \mathcal{M}_{2}^{\sharp}\right) & =\lim _{\mathcal{M}^{\prime} \nearrow\left(\mathcal{M}_{1}^{*} \oplus \mathcal{M}_{2}^{*}\right)} \operatorname{dim}\left(\left(\mathcal{M}_{1}^{b} \oplus \mathcal{M}_{2}^{b}\right) / \mathcal{M}^{\prime}\right)  \tag{1}\\
& =\lim _{\mathcal{M}_{1}^{\prime} \nearrow \mathcal{M}_{1}^{*}, \mathcal{M}_{2}^{\prime} \nearrow \mathcal{M}_{2}^{*}} \operatorname{dim}\left(\left(\mathcal{M}_{1}^{b} \oplus \mathcal{M}_{2}^{b}\right) /\left(\mathcal{M}_{1}^{\prime} \oplus \mathcal{M}_{2}^{\prime}\right)\right) \\
& =\lim _{\mathcal{M}_{1}^{\prime} \nearrow \mathcal{M}_{1}^{*}, \mathcal{M}_{2}^{\prime} \not \mathcal{M}_{2}^{*}} \operatorname{dim}\left(\left(\mathcal{M}_{1}^{b} / \mathcal{M}_{1}^{\prime}\right) \oplus\left(\mathcal{M}_{2}^{b} / \mathcal{M}_{2}^{\prime}\right)\right)
\end{align*}
$$

$$
\begin{aligned}
& =\lim _{\mathcal{M}_{1}^{\prime} \mathcal{\mathcal { M } _ { 1 } ^ { * } , \mathcal { M } _ { 2 } ^ { \prime } \not \mathcal { M } _ { 2 } ^ { * }}}\left(\operatorname{dim}\left(\mathcal{M}_{1}^{b} / \mathcal{M}_{1}^{\prime}\right)+\operatorname{dim}\left(\mathcal{M}_{2}^{b} / \mathcal{M}_{2}^{\prime}\right)\right) \\
& =\operatorname{dim}\left(\mathcal{M}_{1}^{\sharp}\right)+\operatorname{dim}\left(\mathcal{M}_{2}^{\sharp}\right),
\end{aligned}
$$

where $\mathcal{M}^{\prime}\left(\right.$ resp. $\left.\mathcal{M}_{j}^{\prime}\right)$ ranges over finitely generated $R$-submodules of $\mathcal{M}_{1}^{*} \oplus \mathcal{M}_{2}^{*}$ (resp. $\mathcal{N}_{j}^{*}$ ) ordered by inclusion, and the 4th equality comes from (2) of Definition 2.1.

Now consider the case $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$ and $\mathcal{M}_{3} \subseteq \mathcal{M}_{4}$ are finitely generated $R$-modules. We have

$$
\begin{aligned}
\operatorname{dim}\left(\mathcal{M}_{1} \oplus \mathcal{M}_{3} \mid \mathcal{M}_{2} \oplus \mathcal{M}_{4}\right) & =\operatorname{dim}\left(\mathcal{M}_{2} \oplus \mathcal{M}_{4}\right)-\operatorname{dim}\left(\left(\mathcal{M}_{2} \oplus \mathcal{M}_{4}\right) /\left(\mathcal{M}_{1} \oplus \mathcal{M}_{3}\right)\right) \\
& =\operatorname{dim}\left(\mathcal{M}_{2} \oplus \mathcal{M}_{4}\right)-\operatorname{dim}\left(\left(\mathcal{M}_{2} / \mathcal{M}_{1}\right) \oplus\left(\mathcal{M}_{4} / \mathcal{M}_{3}\right)\right) \\
& \stackrel{(1)}{=} \operatorname{dim}\left(\mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{4}\right)-\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}\right)-\operatorname{dim}\left(\mathcal{M}_{4} / \mathcal{M}_{3}\right) \\
& =\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{3} \mid \mathcal{M}_{4}\right)
\end{aligned}
$$

Next consider the case $\mathcal{M}_{1}$ and $\mathcal{M}_{3}$ are finitely generated. We have

$$
\begin{aligned}
\operatorname{dim}\left(\mathcal{M}_{1} \oplus \mathcal{M}_{3} \mid \mathcal{M}_{2} \oplus \mathcal{M}_{4}\right) & =\lim _{\mathcal{M}^{\prime} \nearrow\left(\mathcal{M}_{2} \oplus \mathcal{M}_{4}\right)} \operatorname{dim}\left(\mathcal{M}_{1} \oplus \mathcal{M}_{3} \mid \mathcal{M}^{\prime}\right) \\
& =\lim _{\mathcal{M}_{2}^{\prime} \not \mathcal{M}_{2}, \mathcal{M}_{4}^{\prime} \not \mathcal{M}_{4}} \operatorname{dim}\left(\mathcal{M}_{1} \oplus \mathcal{M}_{3} \mid \mathcal{M}_{2}^{\prime} \oplus \mathcal{M}_{4}^{\prime}\right) \\
& =\lim _{\mathcal{M}_{2}^{\prime} \not \supset \mathcal{\mathcal { M } _ { 2 } , \mathcal { M } _ { 4 } ^ { \prime } \not \supset \mathcal { M } _ { 4 }}}\left(\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}^{\prime}\right)+\operatorname{dim}\left(\mathcal{M}_{3} \mid \mathcal{M}_{4}^{\prime}\right)\right) \\
& =\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{3} \mid \mathcal{M}_{4}\right),
\end{aligned}
$$

where $\mathcal{N}^{\prime}$ (resp. $\mathcal{M}_{j}^{\prime}$ ) ranges over finitely generated $R$-submodules of $\mathcal{M}_{2} \oplus \mathcal{M}_{4}$ (resp. $\mathcal{M}_{j}$ ) containing $\mathcal{M}_{1} \oplus \mathcal{M}_{3}$ (resp. $\mathcal{M}_{j-1}$ ) ordered by inclusion.

Finally consider arbitrary $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$ and $\mathcal{M}_{3} \subseteq \mathcal{M}_{4}$. We have

$$
\begin{aligned}
\operatorname{dim}\left(\mathcal{M}_{1} \oplus \mathcal{M}_{3} \mid \mathcal{M}_{2} \oplus \mathcal{M}_{4}\right) & =\lim _{\mathcal{M}^{\prime} \nearrow\left(\mathcal{M}_{1} \oplus \mathcal{M}_{3}\right)} \operatorname{dim}\left(\mathcal{M}^{\prime} \mid \mathcal{M}_{2} \oplus \mathcal{M}_{4}\right) \\
& =\lim _{\mathcal{M}_{1}^{\prime} \not \mathcal{M}_{1}, \mathcal{M}_{3}^{\prime} \not \mathcal{M}_{3}} \operatorname{dim}\left(\mathcal{M}_{1}^{\prime} \oplus \mathcal{M}_{3}^{\prime} \mid \mathcal{M}_{2} \oplus \mathcal{M}_{4}\right) \\
& =\lim _{\mathcal{M}_{1}^{\prime} \nearrow \mathcal{M}_{1}, \mathcal{M}_{3}^{\prime} \not \mathcal{M}_{3}}\left(\operatorname{dim}\left(\mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{3}^{\prime} \mid \mathcal{M}_{4}\right)\right) \\
& =\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{3} \mid \mathcal{M}_{4}\right),
\end{aligned}
$$

where $\mathcal{M}^{\prime}$ (resp. $\mathcal{M}_{j}^{\prime}$ ) ranges over finitely generated $R$-submodules of $\mathcal{M}_{1} \oplus \mathcal{M}_{3}$ (resp. $\mathcal{M}_{j}$ ) ordered by inclusion.

So far clearly $\operatorname{dim}(\cdot \mid \cdot)$ satisfies all the conditions in Definition 3.1 except that the additivity has not been verified yet. In Lemma 3.22 below we shall actually show that $\operatorname{dim}(\cdot \mid \cdot)$ satisfies the strong additivity in Theorem 3.4, which then proves both Theorems 3.3 and 3.4.

Lemma 3.13. For any $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{2} \subseteq \mathcal{M}_{3}$, if $\mathcal{M}_{1}$ is finitely generated, then

$$
\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right)=\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{3} / \mathcal{M}_{1}\right)
$$

Proof. If $\mathcal{M}_{1}, \mathcal{M}_{2}, \mathcal{M}_{3}$ are all finitely generated, then

$$
\begin{aligned}
\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right) & =\operatorname{dim}\left(\mathcal{M}_{3}\right)-\operatorname{dim}\left(\mathcal{M}_{3} / \mathcal{M}_{2}\right) \\
& =\operatorname{dim}\left(\mathcal{M}_{3}\right)-\operatorname{dim}\left(\mathcal{M}_{3} / \mathcal{M}_{1}\right)+\operatorname{dim}\left(\mathcal{M}_{3} / \mathcal{M}_{1}\right)-\operatorname{dim}\left(\mathcal{M}_{3} / \mathcal{M}_{2}\right) \\
& =\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{3} / \mathcal{M}_{1}\right) .
\end{aligned}
$$

Next when $\mathcal{M}_{1}$ and $\mathcal{M}_{2}$ are finitely generated, we have

$$
\begin{aligned}
\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right) & =\lim _{\mathcal{M}_{3}^{\prime} \not \mathcal{M}_{3}} \operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}^{\prime}\right) \\
& =\lim _{\mathcal{M}_{3}^{\prime} \neq \mathcal{N}_{3}} \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}^{\prime}\right)+\lim _{\mathcal{M}_{3}^{\prime} \mathcal{M}_{3}} \operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{3}^{\prime} / \mathcal{M}_{1}\right) \\
& =\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{3} / \mathcal{M}_{1}\right)
\end{aligned}
$$

where $\mathcal{M}_{3}^{\prime}$ ranges over finitely generated $R$-submodules of $\mathcal{M}_{3}$ containing $\mathcal{M}_{2}$ ordered by inclusion.

Now consider the case $\mathcal{M}_{1}$ is finitely generated. We have

$$
\begin{aligned}
\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right) & =\sup _{\mathcal{M}_{2}^{\prime}} \operatorname{dim}\left(\mathcal{M}_{2}^{\prime} \mid \mathcal{M}_{3}\right) \\
& =\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)+\sup _{\mathcal{M}_{2}^{\prime}}^{\operatorname{sim}}\left(\mathcal{M}_{2}^{\prime} / \mathcal{M}_{1} \mid \mathcal{M}_{3} / \mathcal{M}_{1}\right) \\
& =\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{3} / \mathcal{M}_{1}\right)
\end{aligned}
$$

where $\mathcal{M}_{2}^{\prime}$ ranges over finitely generated $R$-submodules of $\mathcal{M}_{2}$ containing $\mathcal{M}_{1}$.
Lemma 3.14. For any $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$, if $\mathcal{M}_{2}$ is finitely generated, then

$$
\operatorname{dim}\left(\mathcal{M}_{2}\right)=\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}\right) .
$$

Proof. Take a surjective map $\alpha: R^{m} \rightarrow \mathcal{M}_{2}$ for some $m \in \mathbb{N}$. Denote by $\mathcal{M}_{1}^{*}$ the preimage of $\mathcal{M}_{1}$ in $R^{m}$. Let $\varepsilon>0$. Take a finitely generated $R$-submodule $\mathcal{M}_{3}^{\prime}$ of $\mathcal{M}_{1}^{*}$ with

$$
\begin{equation*}
\operatorname{dim}\left(R^{m} / \mathcal{M}_{3}^{\prime}\right) \leq \operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}\right)+\varepsilon . \tag{2}
\end{equation*}
$$

Also take a finitely generated $R$-submodule $\mathcal{M}_{1}^{\prime}$ of $\mathcal{M}_{1}$ containing $\left(\mathcal{M}_{3}^{\prime}\right) \alpha$ such that

$$
\begin{equation*}
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right) \leq \operatorname{dim}\left(\mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{2}\right)+\varepsilon . \tag{3}
\end{equation*}
$$

By Lemma 3.13 we have

$$
\begin{equation*}
\operatorname{dim}\left(\mathcal{M}_{2}\right)=\operatorname{dim}\left(\mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime}\right) \tag{4}
\end{equation*}
$$

and

$$
\begin{equation*}
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)=\operatorname{dim}\left(\mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{1} / \mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{2} / \mathcal{M}_{1}^{\prime}\right) \tag{5}
\end{equation*}
$$

Then

$$
\begin{aligned}
\operatorname{dim}\left(\mathcal{M}_{2}\right) & \stackrel{(4)}{=} \operatorname{dim}\left(\mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime}\right) \\
& \geq \operatorname{dim}\left(\mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}\right)
\end{aligned}
$$

$$
\stackrel{(3)}{\geq} \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)-\varepsilon+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}\right)
$$

where in the first inequality we apply Lemma 3.9. We also have

$$
\begin{aligned}
& \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}\right) \stackrel{(2)}{\geq} \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(R^{m} / \mathcal{M}_{3}^{\prime}\right)-\varepsilon \\
& \geq \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime}\right)-\varepsilon \\
& \stackrel{(5)}{=} \operatorname{dim}\left(\mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{1} / \mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{2} / \mathcal{M}_{1}^{\prime}\right) \\
& \quad+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime}\right)-\varepsilon \\
& \stackrel{(4)}{=} \operatorname{dim}\left(\mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{1} / \mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{2} / \mathcal{M}_{1}^{\prime}\right)-\varepsilon \\
& \geq \operatorname{dim}\left(\mathcal{M}_{2}\right)-\varepsilon,
\end{aligned}
$$

where in the second inequality we apply Lemma 3.9 again. Letting $\varepsilon \rightarrow 0$ we obtain the desired equality.
Lemma 3.15. For any $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{2} \subseteq \mathcal{M}_{3}$, if $\mathcal{M}_{3}$ is finitely generated, then

$$
\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right)=\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{3} / \mathcal{M}_{1}\right) .
$$

Proof. By Lemma 3.14 we have

$$
\begin{aligned}
& \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{3} / \mathcal{M}_{1}\right) \\
= & \operatorname{dim}\left(\mathcal{M}_{3}\right)-\operatorname{dim}\left(\mathcal{M}_{3} / \mathcal{M}_{1}\right)+\operatorname{dim}\left(\mathcal{M}_{3} / \mathcal{M}_{1}\right)-\operatorname{dim}\left(\mathcal{M}_{3} / \mathcal{M}_{2}\right) \\
= & \operatorname{dim}\left(\mathcal{M}_{3}\right)-\operatorname{dim}\left(\mathcal{M}_{3} / \mathcal{M}_{2}\right) \\
= & \operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right) .
\end{aligned}
$$

Lemma 3.16. Let $\mathcal{M}_{1} \subseteq \mathcal{M}_{2} \subseteq \mathcal{M}_{3} \subseteq \mathcal{M}_{4}$ be $R$-modules such that $\mathcal{M}_{2}$ is finitely generated. Then

$$
\begin{equation*}
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)-\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{4}\right) \leq \operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right)-\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{4}\right) . \tag{6}
\end{equation*}
$$

Proof. Since $\mathcal{M}_{2}$ is finitely generated, for $j=3,4$ by Lemma 3.11 we have

$$
0 \leq \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{j}\right) \leq \operatorname{dim}\left(\mathcal{N}_{2} \mid \mathcal{M}_{j}\right) \leq \operatorname{dim}\left(\mathcal{M}_{2}\right)<+\infty
$$

Thus all the four dimensions appearing in (6) are finite.
Consider first the case $\mathcal{M}_{1}$ and $\mathcal{M}_{2}$ are both finitely generated. By Lemma 3.13 we have

$$
\begin{aligned}
\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right)-\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right) & =\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{3} / \mathcal{M}_{1}\right) \\
& \geq \operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{4} / \mathcal{M}_{1}\right) \\
& =\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{4}\right)-\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{4}\right),
\end{aligned}
$$

and hence

$$
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)-\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{4}\right) \leq \operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right)-\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{4}\right) .
$$

Taking limits over finitely generated $R$-submodules of $\mathcal{M}_{1}$, we see that the above inequality also holds when $\mathcal{M}_{2}$ is finitely generated.

Proposition 3.17. For any $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{2} \subseteq \mathcal{M}_{3}$, if $\mathcal{N}_{2}$ is finitely generated, then

$$
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)=\inf _{\mathcal{M}^{\prime}} \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}^{\prime}\right)
$$

where $\mathcal{N}^{\prime}$ ranges over finitely generated $R$-submodules of $\mathcal{M}_{3}$ containing $\mathcal{M}_{2}$.
Proof. Let $\varepsilon>0$. Take a finitely generated $R$-submodule $\mathcal{N}^{\prime}$ of $\mathcal{M}_{3}$ containing $\mathcal{M}_{2}$ such that

$$
\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}^{\prime}\right) \leq \operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right)+\varepsilon .
$$

By Lemma 3.16 we have

$$
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}^{\prime}\right)-\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right) \leq \operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}^{\prime}\right)-\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right) \leq \varepsilon
$$

Lemma 3.18. For any exact sequence

$$
\mathcal{M}_{1} \xrightarrow{\alpha} \mathcal{M}_{2} \rightarrow \mathcal{M}_{3} \rightarrow 0
$$

of finitely generated $R$-modules, we have $\operatorname{dim}\left(\mathcal{M}_{2}\right) \leq \operatorname{dim}\left(\mathcal{M}_{1}\right)+\operatorname{dim}\left(\mathcal{M}_{3}\right)$.
Proof. We have

$$
\begin{aligned}
\operatorname{dim}\left(\mathcal{M}_{2}\right) & =\operatorname{dim}\left(\operatorname{im}(\alpha) \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\mathcal{M}_{3}\right) \\
& \leq \operatorname{dim}(\operatorname{im}(\alpha))+\operatorname{dim}\left(\mathcal{M}_{3}\right) \\
& \leq \operatorname{dim}\left(\mathcal{M}_{1}\right)+\operatorname{dim}\left(\mathcal{M}_{3}\right),
\end{aligned}
$$

where in the last inequality we apply Lemma 3.9.
Proposition 3.19. For any $R$-modules $\mathcal{M}_{1}, \mathcal{M}_{2} \subseteq \mathcal{M}$, we have

$$
\begin{equation*}
\operatorname{dim}\left(\mathcal{M}_{1}+\mathcal{M}_{2} \mid \mathcal{M}\right)+\operatorname{dim}\left(\mathcal{M}_{1} \cap \mathcal{M}_{2} \mid \mathcal{M}\right) \leq \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}\right)+\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}\right) \tag{7}
\end{equation*}
$$

Proof. Note that
$\operatorname{dim}\left(\mathcal{M}_{1}+\mathcal{M}_{2} \mid \mathcal{M}\right)+\operatorname{dim}\left(\mathcal{M}_{1} \cap \mathcal{M}_{2} \mid \mathcal{M}\right)=\sup _{\mathcal{M}_{1}^{\sharp}, \mathcal{M}_{2}^{\sharp}}\left(\operatorname{dim}\left(\mathcal{M}_{1}^{\sharp}+\mathcal{M}_{2}^{\sharp} \mid \mathcal{M}\right)+\operatorname{dim}\left(\mathcal{M}_{1}^{\sharp} \cap \mathcal{\mathcal { M } _ { 2 } ^ { \sharp } | \mathcal { M } ) )}\right.\right.$
and

$$
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}\right)+\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}\right)=\sup _{\mathcal{M}_{1}^{\sharp}, \mathcal{M}_{2}^{\sharp}}\left(\operatorname{dim}\left(\mathcal{M}_{1}^{\sharp} \mid \mathcal{M}\right)+\operatorname{dim}\left(\mathcal{M}_{2}^{\sharp} \mid \mathcal{M}\right)\right)
$$

for $\mathcal{M}_{1}^{\sharp}$ and $\mathcal{M}_{2}^{\sharp}$ ranging over finitely generated $R$-submodules of $\mathcal{N}_{1}$ and $\mathcal{M}_{2}$ respectively. Thus it suffices to prove (7) when $\mathcal{M}_{1}$ and $\mathcal{M}_{2}$ are finitely generated. Then by Proposition 3.17 we may also assume that $\mathcal{M}$ is finitely generated.

By Lemma 3.14 we have

$$
\begin{aligned}
& \operatorname{dim}\left(\mathcal{M}_{1}+\mathcal{M}_{2} \mid \mathcal{M}\right)+\operatorname{dim}\left(\mathcal{M}_{1} \cap \mathcal{M}_{2} \mid \mathcal{M}\right) \\
= & \operatorname{dim}(\mathcal{M})-\operatorname{dim}\left(\mathcal{M} /\left(\mathcal{M}_{1}+\mathcal{M}_{2}\right)\right)+\operatorname{dim}(\mathcal{M})-\operatorname{dim}\left(\mathcal{M} /\left(\mathcal{M}_{1} \cap \mathcal{M}_{2}\right)\right),
\end{aligned}
$$

and

$$
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{N}\right)+\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}\right)=\operatorname{dim}(\mathcal{N})-\operatorname{dim}\left(\mathcal{M} / \mathcal{M}_{1}\right)+\operatorname{dim}(\mathcal{N})-\operatorname{dim}\left(\mathcal{N} / \mathcal{M}_{2}\right) .
$$

Thus it suffices to show

$$
\operatorname{dim}\left(\mathcal{M} / \mathcal{M}_{1}\right)+\operatorname{dim}\left(\mathcal{M} / \mathcal{M}_{2}\right) \leq \operatorname{dim}\left(\mathcal{M} /\left(\mathcal{M}_{1}+\mathcal{M}_{2}\right)\right)+\operatorname{dim}\left(\mathcal{M} /\left(\mathcal{M}_{1} \cap \mathcal{M}_{2}\right)\right)
$$

Note that we have the exact sequence

$$
0 \rightarrow \mathcal{N} /\left(\mathcal{M}_{1} \cap \mathcal{M}_{2}\right) \xrightarrow{\alpha} \mathcal{M} / \mathcal{M}_{1} \oplus \mathcal{M} / \mathcal{M}_{2} \xrightarrow{\beta} \mathcal{N} /\left(\mathcal{M}_{1}+\mathcal{M}_{2}\right) \rightarrow 0
$$

where $\left(z+\mathcal{M}_{1} \cap \mathcal{M}_{2}\right) \alpha=\left(z+\mathcal{M}_{1}, z+\mathcal{M}_{2}\right)$ and $\left(x+\mathcal{M}_{1}, y+\mathcal{M}_{2}\right) \beta=x-y+\mathcal{M}_{1}+\mathcal{M}_{2}$. Then the proposition follows from Lemmas 3.12 and 3.18.
Proposition 3.20. For any $R$-modules $\mathcal{N}_{1} \subseteq \mathcal{M}_{2}$ and $\mathcal{N}$, if $\alpha$ is a map $\mathcal{M}_{2} \rightarrow \mathcal{N}$, then

$$
\operatorname{dim}\left(\left(\mathcal{M}_{1}\right) \alpha \mid\left(\mathcal{M}_{2}\right) \alpha\right) \leq \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)
$$

Proof. Clearly it suffices to consider the case $\mathcal{M}_{1}$ and $\mathcal{M}_{2}$ are both finitely generated. Then $\operatorname{dim}\left(\operatorname{ker}(\alpha) \mid \mathcal{M}_{2}\right) \leq \operatorname{dim}\left(\mathcal{M}_{2}\right)<+\infty$. Applying Proposition 3.19 to $\operatorname{ker}(\alpha), \mathcal{M}_{1} \subseteq \mathcal{M}_{2}$ and using Lemma 3.15, we have

$$
\begin{aligned}
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\operatorname{ker}(\alpha) \mid \mathcal{M}_{2}\right) & \geq \operatorname{dim}\left(\mathcal{M}_{1}+\operatorname{ker}(\alpha) \mid \mathcal{M}_{2}\right) \\
& =\operatorname{dim}\left(\operatorname{ker}(\alpha) \mid \mathcal{M}_{2}\right)+\operatorname{dim}\left(\left(\mathcal{M}_{1}\right) \alpha \mid\left(\mathcal{M}_{2}\right) \alpha\right)
\end{aligned}
$$

and hence $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right) \geq \operatorname{dim}\left(\left(\mathcal{M}_{1}\right) \alpha \mid\left(\mathcal{M}_{2}\right) \alpha\right)$.
Lemma 3.21. For any $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{2} \subseteq \mathcal{M}_{3}$, we have

$$
\begin{equation*}
\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right) \leq \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{3} / \mathcal{M}_{1}\right) \tag{8}
\end{equation*}
$$

Proof. Denote by $\alpha$ the quotient map $\mathcal{M}_{3} \rightarrow \mathcal{M}_{3} / \mathcal{M}_{1}$.
Let $\mathcal{M}_{2}^{\prime}$ be a finitely generated $R$-submodule of $\mathcal{M}_{2}$ and let $\mathcal{M}_{3}^{\prime}$ be a finitely generated $R$-submodule of $\mathcal{M}_{3}$ containing $\mathcal{M}_{2}^{\prime}$. Put $\mathcal{M}^{*}=\mathcal{M}_{3}^{\prime} \cap \mathcal{M}_{1}=\mathcal{M}_{3}^{\prime} \cap \operatorname{ker}(\alpha)$.

Let $\varepsilon>0$. By Proposition 3.17 we can find a finitely generated $R$-submodule $\mathcal{N}_{4}^{\prime}$ of $\mathcal{M}_{3}$ containing $\mathcal{M}_{3}^{\prime}$ such that

$$
\begin{equation*}
\operatorname{dim}\left(\mathcal{M}^{*} \mid \mathcal{M}_{4}^{\prime}\right) \leq \operatorname{dim}\left(\mathcal{M}^{*} \mid \mathcal{M}_{3}\right)+\varepsilon \tag{9}
\end{equation*}
$$

We have

$$
\begin{aligned}
\operatorname{dim}\left(\mathcal{M}_{2}^{\prime} \mid \mathcal{M}_{3}\right) & \leq \operatorname{dim}\left(\mathcal{M}_{2}^{\prime} \mid \mathcal{M}_{4}^{\prime}\right) \\
& \leq \operatorname{dim}\left(\mathcal{M}_{2}^{\prime}+\mathcal{M}^{*} \mid \mathcal{M}_{4}^{\prime}\right) \\
& =\operatorname{dim}\left(\mathcal{M}^{*} \mid \mathcal{M}_{4}^{\prime}\right)+\operatorname{dim}\left(\left(\mathcal{M}_{2}^{\prime}+\mathcal{M}^{*}\right) / \mathcal{M}^{*} \mid \mathcal{M}_{4}^{\prime} / \mathcal{M}^{*}\right) \\
& \leq \operatorname{dim}\left(\mathcal{M}^{*} \mid \mathcal{M}_{4}^{\prime}\right)+\operatorname{dim}\left(\left(\mathcal{M}_{2}^{\prime}+\mathcal{M}^{*}\right) / \mathcal{M}^{*} \mid \mathcal{M}_{3}^{\prime} / \mathcal{M}^{*}\right) \\
& =\operatorname{dim}\left(\mathcal{M}^{*} \mid \mathcal{M}_{4}^{\prime}\right)+\operatorname{dim}\left(\left(\mathcal{M}_{2}^{\prime}\right) \alpha \mid\left(\mathcal{M}_{3}^{\prime}\right) \alpha\right) \\
& \stackrel{(9)}{\leq} \operatorname{dim}\left(\mathcal{M}^{*} \mid \mathcal{M}_{3}\right)+\varepsilon+\operatorname{dim}\left(\left(\mathcal{M}_{2}^{\prime}\right) \alpha \mid\left(\mathcal{M}_{3}^{\prime}\right) \alpha\right)
\end{aligned}
$$

$$
\leq \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)+\varepsilon+\operatorname{dim}\left(\left(\mathcal{M}_{2}^{\prime}\right) \alpha \mid\left(\mathcal{M}_{3}^{\prime}\right) \alpha\right)
$$

where in the first equality we apply Lemma 3.15. Letting $\varepsilon \rightarrow 0$, we get

$$
\operatorname{dim}\left(\mathcal{M}_{2}^{\prime} \mid \mathcal{M}_{3}\right) \leq \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)+\operatorname{dim}\left(\left(\mathcal{M}_{2}^{\prime}\right) \alpha \mid\left(\mathcal{M}_{3}^{\prime}\right) \alpha\right)
$$

Taking infimum over $\mathcal{M}_{3}^{\prime}$, we obtain

$$
\operatorname{dim}\left(\mathcal{M}_{2}^{\prime} \mid \mathcal{M}_{3}\right) \leq \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)+\operatorname{dim}\left(\left(\mathcal{M}_{2}^{\prime}\right) \alpha \mid \mathcal{M}_{3} / \mathcal{M}_{1}\right)
$$

Taking supremum over $\mathcal{M}_{2}^{\prime}$, we get (8).
Lemma 3.22. For any $R$-modules $\mathcal{N}_{1} \subseteq \mathcal{N}_{2} \subseteq \mathcal{N}_{3}$, we have

$$
\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right)=\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{3} / \mathcal{M}_{1}\right) .
$$

Proof. By Lemma 3.21 it suffices to show

$$
\begin{equation*}
\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right) \geq \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{3} / \mathcal{M}_{1}\right) \tag{10}
\end{equation*}
$$

Let $\mathcal{N}_{1}^{\prime}$ be a finitely generated $R$-submodule of $\mathcal{M}_{1}$. By Proposition 3.20 we have

$$
\operatorname{dim}\left(\mathcal{N}_{2} / \mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{3} / \mathcal{M}_{1}^{\prime}\right) \geq \operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{3} / \mathcal{M}_{1}\right)
$$

From Lemma 3.13 we get

$$
\begin{aligned}
\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right) & =\operatorname{dim}\left(\mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{3}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{3} / \mathcal{M}_{1}^{\prime}\right) \\
& \geq \operatorname{dim}\left(\mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{3}\right)+\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{3} / \mathcal{M}_{1}\right)
\end{aligned}
$$

Taking supremum over $\mathcal{M}_{1}^{\prime}$, we obtain (10).
This finishes the proof of Theorems 3.3 and 3.4. In particular, we conclude that Propositions 3.17, 3.19 and 3.20 hold for any bivariant Sylvester module rank function. In the following proposition we list a few basic properties of bivariant Sylvester module rank functions which are easy consequences of Definition 3.1 and will be used frequently.

Proposition 3.23. Let $\operatorname{dim}(\cdot \mid \cdot)$ be a bivariant Sylvester module rank function for $R$. The following hold:
(1) $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)$ is increasing in $\mathcal{M}_{1}$, i.e. for any $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{1}^{\prime} \subseteq \mathcal{M}_{2}$, one has $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right) \leq \operatorname{dim}\left(\mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{2}\right)$.
(2) $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)$ is decreasing in $\mathcal{M}_{2}$, i.e. for any $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{2} \subseteq \mathcal{M}_{2}^{\prime}$, one has $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right) \geq \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}^{\prime}\right)$.
(3) If $\mathcal{M}_{1}$ is generated by $n$ elements for some $n \in \mathbb{N}$, then $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right) \leq n$.

We record the following result which will be used in the proof of Theorem 8.2.
Proposition 3.24. Let $\operatorname{dim}(\cdot \mid \cdot)$ be a bivariant Sylvester module rank function for $R$. Let $\mathcal{M}_{1} \subseteq \mathcal{M}_{2} \subseteq \mathcal{M}_{3} \subseteq \mathcal{M}_{4}$ be $R$-modules with $\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right)<+\infty$. Then

$$
\begin{equation*}
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)-\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{4}\right) \leq \operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right)-\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{4}\right) \tag{11}
\end{equation*}
$$

In particular, if $\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right)=\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{4}\right)<+\infty$, then $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)=\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{4}\right)$.

Proof. From Theorem 3.4 we have

$$
\begin{aligned}
\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right)-\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right) & =\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{3} / \mathcal{M}_{1}\right) \\
& \geq \operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1} \mid \mathcal{M}_{4} / \mathcal{M}_{1}\right) \\
& =\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{4}\right)-\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{4}\right),
\end{aligned}
$$

and hence (11) holds. If $\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{3}\right)=\operatorname{dim}\left(\mathcal{M}_{2} \mid \mathcal{M}_{4}\right)<+\infty$, then we get $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right) \leq$ $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{4}\right)$, and hence $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{3}\right)=\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{4}\right)$.

## 4. Length Functions

Let $R$ be a unital ring. In this section we study the relation between length functions and Sylvester rank functions.

The following is the definition of length function introduced by Northcott and Reufel in [24]. In fact they consider the general case where $\mathrm{L}(R)$ could take any value in $\mathbb{R}_{\geq 0} \cup\{+\infty\}$. For relation with the Sylvester rank functions, we require the normalization $\mathrm{L}(R)=1$ here.

Definition 4.1. A normalized length function for $R$ is an $\mathbb{R}_{\geq 0} \cup\{+\infty\}$-valued function $\mathcal{M} \mapsto \mathrm{L}(\mathcal{M})$ on the class of all $R$-modules satisfying the following properties:
(1) (Normalization) $\mathrm{L}(0)=0$ and $\mathrm{L}(R)=1$.
(2) (Continuity) $\mathrm{L}(\mathcal{M})=\sup _{\mathcal{M}^{\prime}} \mathrm{L}\left(\mathcal{M}^{\prime}\right)$ for $\mathcal{M}^{\prime}$ ranging over all finitely generated $R$-submodules of $\mathcal{M}$.
(3) (Additivity) For any short exact sequence $0 \rightarrow \mathcal{M}_{1} \rightarrow \mathcal{M}_{2} \rightarrow \mathcal{M}_{3} \rightarrow 0$ of $R$-modules, one has $\mathrm{L}\left(\mathcal{M}_{2}\right)=\mathrm{L}\left(\mathcal{M}_{1}\right)+\mathrm{L}\left(\mathcal{M}_{3}\right)$.

It follows from the additivity and normalization conditions that each normalized length function is an isomorphism invariant. Clearly the restriction of each normalized length function to the class of finitely presented $R$-modules is a Sylvester module rank function. Furthermore, if L is a normalized length function for $R$, then $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right):=\mathrm{L}\left(\mathcal{M}_{1}\right)$ for $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$ is a bivariant Sylvester module rank function for $R$.

Proposition 4.2. Let $\operatorname{dim}(\cdot \mid \cdot)$ be a bivariant Sylvester module rank function for $R$. The following are equivalent.
(1) $\operatorname{dim}(\cdot)$ is a normalized length function.
(2) For any $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$ one has $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)=\operatorname{dim}\left(\mathcal{M}_{1}\right)$.
(3) For any exact sequence

$$
0 \rightarrow \mathcal{M}_{1} \rightarrow \mathcal{M}_{2} \rightarrow \mathcal{M}_{3} \rightarrow 0
$$

of $R$-modules such that $\mathcal{M}_{2}$ and $\mathcal{M}_{3}$ are finitely presented (then $\mathcal{M}_{1}$ must be finitely generated by [16, Proposition 4.26]), one has $\operatorname{dim}\left(\mathcal{M}_{2}\right)=\operatorname{dim}\left(\mathcal{M}_{1}\right)+$ $\operatorname{dim}\left(\mathcal{M}_{3}\right)$.

Proof. $(2) \Rightarrow(1) \Rightarrow(3)$ is trivial.
$(3) \Rightarrow(2)$ : Assume that (3) holds. Let $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$ be finitely generated $R$-modules. Take a surjective map $\alpha: R^{m} \rightarrow \mathcal{M}_{2}$ for some $m \in \mathbb{N}$. Take a finitely generated $R$-submodule $\mathcal{M}_{1}^{*}$ of $R^{m}$ with $\left(\mathcal{M}_{1}^{*}\right) \alpha=\mathcal{M}_{1}$. Let $\mathcal{M}^{*}$ be a finitely generated $R$ submodule of $\operatorname{ker}(\alpha)$. Then we have the exact sequence

$$
0 \rightarrow\left(\mathcal{M}^{*}+\mathcal{M}_{1}^{*}\right) / \mathcal{M}^{*} \rightarrow R^{m} / \mathcal{M}^{*} \rightarrow R^{m} /\left(\mathcal{M}^{*}+\mathcal{M}_{1}^{*}\right) \rightarrow 0
$$

and both $R^{m} / \mathcal{M}^{*}$ and $R^{m} /\left(\mathcal{M}^{*}+\mathcal{M}_{1}^{*}\right)$ are finitely presented. Thus

$$
\operatorname{dim}\left(R^{m} / \mathcal{M}^{*}\right)=\operatorname{dim}\left(\left(\mathcal{M}^{*}+\mathcal{M}_{1}^{*}\right) / \mathcal{M}^{*}\right)+\operatorname{dim}\left(R^{m} /\left(\mathcal{M}^{*}+\mathcal{M}_{1}^{*}\right)\right)
$$

by (3). Note that $\mathcal{M}_{1}$ is a quotient module of $\left(\mathcal{M}^{*}+\mathcal{M}_{1}^{*}\right) / \mathcal{M}^{*}$. Thus $\operatorname{dim}\left(\left(\mathcal{M}^{*}+\right.\right.$ $\left.\left.\mathcal{M}_{1}^{*}\right) / \mathcal{N}^{*}\right) \geq \operatorname{dim}\left(\mathcal{M}_{1}\right)$, and hence

$$
\operatorname{dim}\left(R^{m} / \mathcal{M}^{*}\right)-\operatorname{dim}\left(R^{m} /\left(\mathcal{M}^{*}+\mathcal{M}_{1}^{*}\right)\right) \geq \operatorname{dim}\left(\mathcal{M}_{1}\right)
$$

Then we have

$$
\begin{aligned}
& \operatorname{dim}\left(\mathcal{M}_{1}\right) \geq \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right) \\
& =\operatorname{dim}\left(\mathcal{M}_{2}\right)-\operatorname{dim}\left(\mathcal{M}_{2} / \mathcal{M}_{1}\right) \\
& =\lim _{\mathcal{M}^{*} / / \operatorname{ker}(\alpha)} \operatorname{dim}\left(R^{m} / \mathcal{M}^{*}\right)-\lim _{\mathcal{M}^{*} / \operatorname{ker}(\alpha)} \operatorname{dim}\left(R^{m} /\left(\mathcal{M}^{*}+\mathcal{M}_{1}^{*}\right)\right) \\
& \geq \operatorname{dim}\left(\mathcal{M}_{1}\right),
\end{aligned}
$$

where in the third line $\mathcal{M}^{*}$ ranges over finitely generated $R$-submodules of $\operatorname{ker}(\alpha)$ ordered by inclusion. It follows that

$$
\operatorname{dim}\left(\mathcal{M}_{1}\right)=\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)
$$

Taking infimum over finitely generated $R$-submodules of $\mathcal{M}_{2}$ containing $\mathcal{M}_{1}$, we see that the above equality holds whenever $\mathcal{M}_{1}$ is finitely generated. For any $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$, we get

$$
\operatorname{dim}\left(\mathcal{M}_{1}\right)=\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{1}\right)=\sup _{\mathcal{M}_{1}^{\prime}} \operatorname{dim}\left(\mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{1}\right)=\sup _{\mathcal{M}_{1}^{\prime}} \operatorname{dim}\left(\mathcal{M}_{1}^{\prime} \mid \mathcal{M}_{2}\right)=\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)
$$

where $\mathcal{M}_{1}^{\prime}$ ranges over finitely generated $R$-submodules of $\mathcal{M}_{1}$.
From Theorem 3.3, Lemma 3.8 and Proposition 4.2 we obtain the following recent result of Virili.

Corollary 4.3 ([30]). Let dim be a Sylvester module rank function for $R$. Then dim extends to a normalized length function for $R$ if and only if for any surjective map $\alpha: \mathcal{M}_{1} \rightarrow \mathcal{M}_{2}$ of finitely presented $R$-modules one has $\operatorname{dim}\left(\mathcal{M}_{1}\right)-\operatorname{dim}\left(\mathcal{M}_{2}\right)=$ $\inf _{\mathcal{M}} \operatorname{dim}(\mathcal{M})$ for $\mathcal{M}$ ranging over finitely presented $R$-modules admitting $\operatorname{ker}(\alpha)$ as a quotient module. Furthermore, in such case the extension is unique.

If $R$ is von Neumann regular, i.e. for any $x \in R$ there is some $y \in R$ with $x y x=x$, then every finitely presented $R$-module is projective [12] [17, Exercise 6.19], and hence every bivariant Sylvester module rank function for $R$ is a normalized length function.

## 5. Direct Limits

In this section we prove Proposition 5.2, which gives the continuity of bivariant Sylvester rank functions with respect to direct limits.

Let $R$ be a unital ring and let $\operatorname{dim}(\cdot \mid \cdot)$ be a bivariant Sylvester module rank function for $R$.

Proposition 5.1. Let $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$ be $R$-modules such that $\mathcal{M}_{1}$ is finitely generated. For each $R$-submodule $\mathcal{M}$ of $\mathcal{M}_{2}$ denote by $\gamma_{\mathcal{M}}$ the quotient map $\mathcal{M}_{2} \rightarrow \mathcal{M}_{2} / \mathcal{M}$. Then for any $R$-submodule $\mathcal{M}$ of $\mathcal{N}_{2}$, we have

$$
\operatorname{dim}\left(\left(\mathcal{M}_{1}\right) \gamma_{\mathcal{M}} \mid \mathcal{M}_{2} / \mathcal{M}\right)=\inf _{\mathcal{M}^{\prime}} \operatorname{dim}\left(\left(\mathcal{M}_{1}\right) \gamma_{\mathcal{M}^{\prime}} \mid \mathcal{M}_{2} / \mathcal{M}^{\prime}\right)
$$

for $\mathcal{N}^{\prime}$ ranging over finitely generated $R$-submodules of $\mathcal{M}$.
Proof. For each $R$-submodule $\mathcal{M}^{\prime}$ of $\mathcal{M}$, since $\gamma_{\mathcal{M}}$ factors through $\gamma_{\mathcal{M}^{\prime}}$, by Proposition 3.20 we have

$$
\operatorname{dim}\left(\left(\mathcal{M}_{1}\right) \gamma_{\mathcal{M}} \mid \mathcal{M}_{2} / \mathcal{M}\right) \leq \operatorname{dim}\left(\left(\mathcal{M}_{1}\right) \gamma_{\mathcal{N}^{\prime}} \mid \mathcal{M}_{2} / \mathcal{M}^{\prime}\right)
$$

Let $\varepsilon>0$. Take a finitely generated $R$-submodule $\mathcal{M}^{\dagger}$ of $\mathcal{M}_{2} / \mathcal{M}$ containing $\left(\mathcal{M}_{1}\right) \gamma_{\mathfrak{M}}$ such that

$$
\operatorname{dim}\left(\left(\mathcal{M}_{1}\right) \gamma_{\mathcal{M}} \mid \mathcal{M}^{\dagger}\right) \leq \operatorname{dim}\left(\left(\mathcal{M}_{1}\right) \gamma_{\mathcal{M}} \mid \mathcal{M}_{2} / \mathcal{M}\right)+\varepsilon
$$

Take a finitely generated $R$-submodule $\mathcal{M}_{2}^{\sharp}$ of $\mathcal{M}_{2}$ containing $\mathcal{M}_{1}$ such that $\left(\mathcal{M}_{2}^{\sharp}\right) \gamma_{\mathcal{M}}=$ $\mathcal{M}^{\dagger}$. Since $\operatorname{dim}\left(\mathcal{N}_{2}^{\sharp} \cap \mathcal{M} \mid \mathcal{M}_{2}^{\sharp}\right) \leq \operatorname{dim}\left(\mathcal{M}_{2}^{\sharp}\right)<+\infty$, we can find a finitely generated $R$-submodule $\mathcal{M}^{\prime}$ of $\mathcal{M}{ }_{2}^{\sharp} \cap \mathcal{M}$ such that

$$
\operatorname{dim}\left(\mathcal{M}_{2}^{\sharp} \cap \mathcal{M} \mid \mathcal{M}_{2}^{\sharp}\right) \leq \operatorname{dim}\left(\mathcal{M}^{\prime} \mid \mathcal{M}_{2}^{\sharp}\right)+\varepsilon .
$$

Then by Theorem 3.4 we have

$$
\operatorname{dim}\left(\left(\mathcal{M}_{2}^{\sharp} \cap \mathcal{M}\right) \gamma_{\mathcal{M}^{\prime}} \mid\left(\mathcal{M}_{2}^{\sharp}\right) \gamma_{\mathcal{M}^{\prime}}\right)=\operatorname{dim}\left(\mathcal{M}_{2}^{\sharp} \cap \mathcal{M} \mid \mathcal{M}_{2}^{\sharp}\right)-\operatorname{dim}\left(\mathcal{M}^{\prime} \mid \mathcal{M}_{2}^{\sharp}\right) \leq \varepsilon .
$$

Now we have

$$
\begin{aligned}
& \operatorname{dim}\left(\left(\mathcal{M}_{1}\right) \gamma_{\mathcal{M}^{\prime}} \mid \mathcal{M}_{2} / \mathcal{M}^{\prime}\right) \\
\leq & \operatorname{dim}\left(\left(\mathcal{M}_{1}\right) \gamma_{\mathcal{M}^{\prime}} \mid\left(\mathcal{M}_{2}^{\sharp}\right) \gamma_{\mathcal{M}^{\prime}}\right) \\
\leq & \operatorname{dim}\left(\left(\mathcal{M}_{1}+\left(\mathcal{M}_{2}^{\sharp} \cap \mathcal{M}\right)\right) \gamma_{\mathcal{M}^{\prime}} \mid\left(\mathcal{M}_{2}^{\sharp}\right) \gamma_{\mathcal{M}^{\prime}}\right) \\
= & \operatorname{dim}\left(\left(\mathcal{M}_{2}^{\sharp} \cap \mathcal{M}\right) \gamma_{\mathcal{M}^{\prime}} \mid\left(\mathcal{M}_{2}^{\sharp}\right) \gamma_{\mathcal{M}^{\prime}}\right)+\operatorname{dim}\left(\left(\mathcal{M}_{1}\right) \gamma_{\mathcal{M}_{2}^{\sharp} \cap \mathcal{M}} \mid\left(\mathcal{M}_{2}^{\sharp}\right) \gamma_{\mathcal{M}_{2}^{\sharp} \cap \mathcal{M}}\right) \\
= & \operatorname{dim}\left(\left(\mathcal{M}_{2}^{\sharp} \cap \mathcal{M}\right) \gamma_{\mathcal{M}^{\prime}} \mid\left(\mathcal{M}_{2}^{\sharp}\right) \gamma_{\mathcal{K}^{\prime}}\right)+\operatorname{dim}\left(\left(\mathcal{M}_{1}\right) \gamma_{\mathcal{M}} \mid\left(\mathcal{M}_{2}^{\sharp}\right) \gamma_{\mathcal{M}}\right) \\
\leq & \operatorname{dim}\left(\left(\mathcal{M}_{1}\right) \gamma_{\mathcal{M}} \mid \mathcal{M}_{2} / \mathcal{M}\right)+2 \varepsilon,
\end{aligned}
$$

where in the first equality we apply Theorem 3.4 again.
By a direct system of $R$-modules we mean a family $\left\{\mathcal{M}_{j}\right\}_{j \in J}$ of $R$-modules indexed by a directed set $J$ and a map $\beta_{j k}: \mathcal{M}_{j} \rightarrow \mathcal{M}_{k}$ for all $j \leq k$ such that $\beta_{j j}=\operatorname{id}_{\mathcal{M}_{j}}$ for all $j$ and $\beta_{i j} \beta_{j k}=\beta_{i k}$ for all $i \leq j \leq k$. For any direct system $\left(\mathcal{M}_{j}, \beta_{j k}\right)$ of $R$-modules over a directed set $J$, one has the direct limit $\lim _{\mathcal{M}}^{k}$ [27, Proposition B-7.7]. For an $R$-module $\mathcal{M}$, we say that maps $\alpha_{j}: \mathcal{M} \rightarrow \overrightarrow{\mathcal{M}}_{j}$ for each $j \in J$ and $\alpha_{\infty}: \mathcal{M} \rightarrow \underline{\longrightarrow} \mathcal{M}_{k}$ are compatible if $\alpha_{j} \beta_{j k}=\alpha_{k}$ for all $j \leq k$ and $\alpha_{j} \beta_{j}=\alpha_{\infty}$ for all $j \in J$, where $\beta_{j}$ is the canonical map $\mathcal{M}_{j} \rightarrow \xrightarrow[\longrightarrow]{\lim } \mathcal{M}_{k}$.

Proposition 5.2. Let $\left(\mathcal{M}_{j}, \beta_{j k}\right)$ be a direct system of $R$-modules over a directed set $J$ with direct limit $\mathcal{M}_{\infty}$. Let $\mathcal{M}$ be an $R$-module with compatible maps $\alpha_{j}: \mathcal{M} \rightarrow \mathcal{N}_{j}$ and $\alpha_{\infty}: \mathcal{M} \rightarrow \mathcal{M}_{\infty}$. Suppose that $\operatorname{dim}\left(\operatorname{im}\left(\alpha_{i}\right) \mid \mathcal{M}_{i}\right)<+\infty$ for some $i \in J$. Then

$$
\operatorname{dim}\left(\operatorname{im}\left(\alpha_{\infty}\right) \mid \mathcal{M}_{\infty}\right)=\lim _{j \rightarrow \infty} \operatorname{dim}\left(\operatorname{im}\left(\alpha_{j}\right) \mid \mathcal{M}_{j}\right)=\inf _{j \in J} \operatorname{dim}\left(\operatorname{im}\left(\alpha_{j}\right) \mid \mathcal{M}_{j}\right)
$$

Proof. From Proposition 3.20 we know that $\operatorname{dim}\left(\operatorname{im}\left(\alpha_{j}\right) \mid \mathcal{M}_{j}\right)$ decreases. Thus

$$
\operatorname{dim}\left(\operatorname{im}\left(\alpha_{\infty}\right) \mid \mathcal{M}_{\infty}\right) \leq \lim _{j \rightarrow \infty} \operatorname{dim}\left(\operatorname{im}\left(\alpha_{j}\right) \mid \mathcal{M}_{j}\right)=\inf _{j \in J} \operatorname{dim}\left(\operatorname{im}\left(\alpha_{j}\right) \mid \mathcal{M}_{j}\right)
$$

Let $\varepsilon>0$. Take a finitely generated $R$-submodule $\mathcal{N}^{\sharp}$ of $\mathcal{M}$ with

$$
\begin{equation*}
\operatorname{dim}\left(\operatorname{im}\left(\alpha_{i}\right) \mid \mathcal{M}_{i}\right) \leq \operatorname{dim}\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{i} \mid \mathcal{M}_{i}\right)+\varepsilon . \tag{12}
\end{equation*}
$$

Denote by $\beta_{j}$ the map $\mathcal{M}_{j} \rightarrow \mathcal{M}_{\infty}$, and for each submodule $\mathcal{N}^{\dagger}$ of $\mathcal{M}_{j}$ denote by $\gamma_{\mathcal{M}^{\dagger}}$ the quotient map $\mathcal{M}_{j} \rightarrow \mathcal{M}_{j} / \mathcal{M}^{\dagger}$. Take $j \in J$ with $j \geq i$ such that

$$
\operatorname{dim}\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{\infty} \mid \operatorname{im}\left(\beta_{j}\right)\right) \leq \operatorname{dim}\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{\infty} \mid \mathcal{M}_{\infty}\right)+\varepsilon .
$$

Note that
$\operatorname{dim}\left(\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{j}\right) \gamma_{\operatorname{ker}\left(\beta_{j}\right)} \mid \mathcal{M}_{j} / \operatorname{ker}\left(\beta_{j}\right)\right)=\operatorname{dim}\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{\infty} \mid \operatorname{im}\left(\beta_{j}\right)\right) \leq \operatorname{dim}\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{\infty} \mid \mathcal{M}_{\infty}\right)+\varepsilon$. By Proposition 5.1 we can find a finitely generated $R$-submodule $\mathcal{M}^{\dagger}$ of $\operatorname{ker}\left(\beta_{j}\right)$ with

$$
\begin{aligned}
\operatorname{dim}\left(\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{j}\right) \gamma_{\mathcal{M}^{\dagger}} \mid \mathcal{M}_{j} / \mathcal{M}^{\dagger}\right) & \leq \operatorname{dim}\left(\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{j}\right) \gamma_{\mathrm{ker}\left(\beta_{j}\right)} \mid \mathcal{M}_{j} / \operatorname{ker}\left(\beta_{j}\right)\right)+\varepsilon \\
& \leq \operatorname{dim}\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{\infty} \mid \mathcal{M}_{\infty}\right)+2 \varepsilon .
\end{aligned}
$$

Take $k \geq j$ such that $\left(\mathcal{M}^{\dagger}\right) \beta_{j k}=0$. Then $\beta_{j k}$ factors through $\gamma_{\mathcal{M}^{\dagger}}$. Thus by Proposition 3.20 we have

$$
\operatorname{dim}\left(\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{j}\right) \beta_{j k} \mid \operatorname{im}\left(\beta_{j k}\right)\right) \leq \operatorname{dim}\left(\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{j}\right) \gamma_{\mathcal{N}^{\dagger}} \mid \mathcal{M}_{j} / \mathcal{M}^{\dagger}\right) \leq \operatorname{dim}\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{\infty} \mid \mathcal{M}_{\infty}\right)+2 \varepsilon,
$$

and hence

$$
\begin{aligned}
\operatorname{dim}\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{k} \mid \mathcal{M}_{k}\right) & \leq \operatorname{dim}\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{k} \mid \operatorname{im}\left(\beta_{j k}\right)\right) \\
& =\operatorname{dim}\left(\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{j}\right) \beta_{j k} \mid \operatorname{im}\left(\beta_{j k}\right)\right) \\
& \leq \operatorname{dim}\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{\infty} \mid \mathcal{M}_{\infty}\right)+2 \varepsilon .
\end{aligned}
$$

Since $\beta_{i k} \gamma_{\left(\mathcal{M}^{\sharp}\right) \alpha_{k}}$ factors through $\gamma_{\left(\mathcal{N}^{\sharp}\right) \alpha_{i}}$, by Proposition 3.20 and Theorem 3.4 we have

$$
\begin{aligned}
\operatorname{dim}\left(\left(\operatorname{im}\left(\alpha_{i}\right)\right) \beta_{i k} \gamma_{\left(\mathcal{M}^{\sharp}\right) \alpha_{k}} \mid\left(\mathcal{M}_{i}\right) \beta_{i k} \gamma_{\left(\mathcal{M}_{\sharp}^{\sharp}\right) \alpha_{k}}\right) & \leq \operatorname{dim}\left(\left(\operatorname{im}\left(\alpha_{i}\right)\right) \gamma_{\left(\mathcal{M}^{\sharp}\right)\left(\alpha_{i}\right)} \mid\left(\mathcal{M}_{i}\right) \gamma_{\left(\mathcal{M}_{\sharp}^{\sharp}\right)\left(\alpha_{i}\right)}\right) \\
& =\operatorname{dim}\left(\operatorname{im}\left(\alpha_{i}\right) \mid \mathcal{M}_{i}\right)-\operatorname{dim}\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{i} \mid \mathcal{M}_{i}\right) \\
& \leq \varepsilon .
\end{aligned}
$$

Now by Theorem 3.4 we have

$$
\begin{aligned}
\operatorname{dim}\left(\operatorname{im}\left(\alpha_{k}\right) \mid \mathcal{M}_{k}\right) & =\operatorname{dim}\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{k} \mid \mathcal{M}_{k}\right)+\operatorname{dim}\left(\left(\operatorname{im}\left(\alpha_{k}\right)\right) \gamma_{\left(\mathcal{M}_{\sharp}^{\sharp}\right) \alpha_{k}} \mid\left(\mathcal{M}_{k}\right) \gamma_{(\mathcal{M} \sharp) \alpha_{k}}\right) \\
& \leq \operatorname{dim}\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{k} \mid \mathcal{M}_{k}\right)+\operatorname{dim}\left(\left(\operatorname{im}\left(\alpha_{i}\right)\right) \beta_{i k} \gamma_{\left(\mathcal{M}^{\sharp}\right) \alpha_{k}} \mid\left(\mathcal{M}_{i}\right) \beta_{i k} \gamma_{\left(\mathcal{M}^{\sharp}\right) \alpha_{k}}\right) \\
& \leq \operatorname{dim}\left(\left(\mathcal{M}^{\sharp}\right) \alpha_{\infty} \mid \mathcal{M}_{\infty}\right)+3 \varepsilon \\
& \leq \operatorname{dim}\left(\operatorname{im}\left(\alpha_{\infty}\right) \mid \mathcal{M}_{\infty}\right)+3 \varepsilon .
\end{aligned}
$$

This means

$$
\inf _{k \in J} \operatorname{dim}\left(\operatorname{im}\left(\alpha_{k}\right) \mid \mathcal{M}_{k}\right) \leq \operatorname{dim}\left(\operatorname{im}\left(\alpha_{\infty}\right) \mid \mathcal{M}_{\infty}\right)+3 \varepsilon
$$

Letting $\varepsilon \rightarrow 0$, we finish the proof.
Note that for any $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$, the family $\left\{\mathcal{M}_{1}+\mathcal{M}^{\dagger}\right\}$ for $\mathcal{M}^{\dagger}$ ranging over finitely generated $R$-submodules of $\mathcal{M}_{2}$ form a direct system naturally with direct limit $\mathcal{M}_{2}$. The following consequence of Proposition 5.2 strengthens the continuity condition (5) of Definition 3.1.

Corollary 5.3. Let $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$ be $R$-modules. Suppose that $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{1}+\mathcal{M}^{\dagger}\right)<+\infty$ for some finitely generated $R$-submodule $\mathcal{M}^{\dagger}$ of $\mathcal{M}_{2}$. Then

$$
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)=\lim _{\mathcal{M}_{2}^{\prime} \not \mathcal{M}_{2}} \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{1}+\mathcal{M}_{2}^{\prime}\right)=\inf _{\mathcal{M}_{2}^{\prime}} \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{1}+\mathcal{M}_{2}^{\prime}\right)
$$

for $\mathcal{M}_{2}^{\prime}$ ranging over finitely generated $R$-submodules of $\mathcal{M}_{2}$ ordered by inclusion.
Remark 5.4. The condition $\operatorname{dim}\left(\operatorname{im}\left(\alpha_{i}\right) \mid \mathcal{M}_{i}\right)<+\infty$ for some $i \in J$ in Proposition 5.2 cannot be dropped. For example, take $\mathcal{M}=\bigoplus_{n \in \mathbb{N}} R, J=\mathbb{N}, \mathcal{M}_{j}=\bigoplus_{n \geq j} R$ with the maps $\mathcal{M} \rightarrow \mathcal{M}_{j}$ and $\mathcal{M}_{j} \rightarrow \mathcal{M}_{k}$ for $j \leq k$ being natural projections. Then $\mathcal{M}_{\infty}=\{0\}$, and hence $\operatorname{dim}\left(\operatorname{im}\left(\alpha_{\infty}\right) \mid \mathcal{M}_{\infty}\right)=0$. But $\operatorname{dim}\left(\operatorname{im}\left(\alpha_{j}\right) \mid \mathcal{M}_{j}\right)=$ $\operatorname{dim}\left(\mathcal{M}_{j} \mid \mathcal{M}_{j}\right)=\infty$ for all $j \in \mathbb{N}$.

Also, the condition $\operatorname{dim}\left(\mathcal{N}_{1} \mid \mathcal{M}_{1}+\mathcal{N}^{\dagger}\right)<+\infty$ for some finitely generated $R$ submodule $\mathcal{N}^{\dagger}$ of $\mathcal{M}_{2}$ in Corollary 5.3 cannot be dropped. Suppose that $\mathcal{M}_{1}^{*} \subseteq \mathcal{M}_{2}^{*}$ are finitely generated $R$-modules with $\operatorname{dim}\left(\mathcal{M}_{1}^{*}\right)>0$ and $\operatorname{dim}\left(\mathcal{N}_{1}^{*} \mid \mathcal{M}_{2}^{*}\right)=0$ (see Example 3.2 for such an example). Set $\mathcal{M}_{1}=\bigoplus_{n \in \mathbb{N}} \mathcal{M}_{1}^{*}$ and $\mathcal{M}_{2}=\bigoplus_{n \in \mathbb{N}} \mathcal{M}_{2}^{*}$. Then

$$
\operatorname{dim}\left(\bigoplus_{n=1}^{m} \mathcal{M}_{1}^{*} \mid \mathcal{M}_{2}\right) \leq \operatorname{dim}\left(\bigoplus_{n=1}^{m} \mathcal{M}_{1}^{*} \mid \bigoplus_{n=1}^{m} \mathcal{M}_{2}^{*}\right)=\sum_{n=1}^{m} \operatorname{dim}\left(\mathcal{M}_{1}^{*} \mid \mathcal{M}_{2}^{*}\right)=0
$$

for every $m \in \mathbb{N}$. Since every finitely generated $R$-submodule of $\mathcal{M}_{1}$ is contained in $\bigoplus_{n=1}^{m} \mathcal{M}_{1}^{*}$ for some $m \in \mathbb{N}$, this shows that $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right)=0$. For any finitely generated $R$-submodule $\mathcal{M}_{2}^{\prime}$ of $\mathcal{M}_{2}$, we have $\mathcal{M}_{2}^{\prime} \subseteq \bigoplus_{n=1}^{m} \mathcal{N}_{2}^{*}$ for some $m \in \mathbb{N}$. Thus

$$
\begin{aligned}
\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{1}+\mathcal{M}_{2}^{\prime}\right) & \geq \operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{1}+\bigoplus_{n=1}^{m} \mathcal{M}_{2}^{*}\right) \\
& =\operatorname{dim}\left(\bigoplus_{n>m} \mathcal{M}_{1}^{*}\right)+\operatorname{dim}\left(\bigoplus_{n=1}^{m} \mathcal{M}_{1}^{*} \mid \bigoplus_{n=1}^{m} \mathcal{M}_{2}^{*}\right) \\
& =+\infty
\end{aligned}
$$

## 6. Extended Sylvester Map Rank Functions

Let $R$ be a unital ring. In this section we introduce extended Sylvester map rank functions and show that they are in natural one-to-one correspondence with bivariant Sylvester module rank functions.

Definition 6.1. An extended Sylvester map rank function for $R$ is an $\mathbb{R}_{\geq 0} \cup\{+\infty\}$ valued function rk on the class of all maps between $R$-modules satisfying the following conditions:
(1) $\operatorname{rk}(0)=0, \operatorname{rk}\left(\mathrm{id}_{R}\right)=1$.
(2) $\operatorname{rk}(\alpha \beta) \leq \min (\operatorname{rk}(\alpha), \operatorname{rk}(\beta))$.
(3) $\operatorname{rk}\left(\left[\begin{array}{ll}\alpha & \\ & \beta\end{array}\right]\right)=\operatorname{rk}(\alpha)+\operatorname{rk}(\beta)$.
(4) (Continuity) Let $\left(\mathcal{M}_{j}, \beta_{j k}\right)$ be a direct system of $R$-modules over a directed set $J$ with direct limit $\mathcal{N}_{\infty}$. Let $\mathcal{M}$ be an $R$-module with compatible maps $\alpha_{j}: \mathcal{M}_{j} \rightarrow \mathcal{M}$ and $\alpha_{\infty}: \mathcal{M}_{\infty} \rightarrow \mathcal{M}$, i.e. $\beta_{j k} \alpha_{k}=\alpha_{j}$ for all $j \leq k$ and $\beta_{j} \alpha_{\infty}=\alpha_{j}$ for all $j \in J$, where $\beta_{j}$ is the canonical map $\mathcal{M}_{j} \rightarrow \mathcal{M}_{\infty}$. Then

$$
\operatorname{rk}\left(\alpha_{\infty}\right)=\lim _{j \rightarrow \infty} \operatorname{rk}\left(\alpha_{j}\right)
$$

(5) (Continuity) Let $\left(\mathcal{M}_{j}, \beta_{j k}\right)$ be a direct system of $R$-modules over a directed set $J$ with direct limit $\mathcal{M}_{\infty}$. Let $\mathcal{M}$ be a finitely generated $R$-module with compatible maps $\alpha_{j}: \mathcal{M} \rightarrow \mathcal{M}_{j}$ and $\alpha_{\infty}: \mathcal{M} \rightarrow \mathcal{M}_{\infty}$. Then

$$
\operatorname{rk}\left(\alpha_{\infty}\right)=\lim _{j \rightarrow \infty} \operatorname{rk}\left(\alpha_{j}\right)
$$

(6) (Additivity) For any map $\alpha: \mathcal{M}_{1} \rightarrow \mathcal{M}_{2}$ between $R$-modules, one has

$$
\operatorname{rk}\left(\operatorname{id}_{\mathcal{M}_{2}}\right)=\operatorname{rk}(\alpha)+\operatorname{rk}\left(\operatorname{id}_{\operatorname{coker}(\alpha)}\right)
$$

Theorem 6.2. There is a natural 1-1 correspondence between bivariant Sylvester module rank functions for $R$ and extended Sylvester map rank functions for $R$ as follows.
(1) Let rk be an extended Sylvester map rank function for $R$. For any $R$-modules $\mathcal{M}_{1} \subseteq \mathcal{M}_{2}$, define $\operatorname{dim}\left(\mathcal{M}_{1} \mid \mathcal{M}_{2}\right):=\operatorname{rk}\left(\gamma_{\mathcal{M}_{1} \subseteq \mathcal{M}_{2}}\right)$, where $\gamma_{\mathcal{M}_{1} \subseteq \mathcal{M}_{2}}$ denotes the embedding map $\mathcal{M}_{1} \hookrightarrow \mathcal{M}_{2}$. Then $\operatorname{dim}(\cdot \mid \cdot)$ is a bivariant Sylvester module rank function for $R$.
(2) Let $\operatorname{dim}(\cdot \mid \cdot)$ be a bivariant Sylvester module rank function for $R$. For any map $\alpha: \mathcal{M}_{1} \rightarrow \mathcal{M}_{2}$ of $R$-modules, define $\operatorname{rk}(\alpha):=\operatorname{dim}\left(\operatorname{im}(\alpha) \mid \mathcal{M}_{2}\right)$. Then rk is an extended Sylvester map rank function for $R$.
Proof. (1) is trivial. To prove (2), let $\operatorname{dim}(\cdot \mid \cdot)$ be a bivariant Sylvester module rank function for $R$ and define rk as in (2). Conditions (2) and (5) of Definition 6.1 follow easily from Propositions 3.20 and 5.2 respectively. Thus rk is an extended Sylvester map rank function for $R$.

If we start with a bivariant Sylvester module rank function $\operatorname{dim}(\cdot \mid \cdot)$ for $R$, obtain an extended Sylvester map rank function rk by (2), and then obtain a bivariant Sylvester module rank function $\operatorname{dim}^{\prime}(\cdot \mid \cdot)$ by (1) using rk, then clearly $\operatorname{dim}=\operatorname{dim}^{\prime}$.

Now we start with an extended Sylvester map rank function rk, obtain a bivariant Sylvester module rank function $\operatorname{dim}(\cdot \mid \cdot)$ by (1), and then obtain an extended Sylvester map rank function $\mathrm{rk}^{\prime}$ by (2) using $\operatorname{dim}(\cdot \mid \cdot)$. We need to show that $\operatorname{rk}(\alpha)=\operatorname{rk}^{\prime}(\alpha)$ for any map $\alpha: \mathcal{M}_{1} \rightarrow \mathcal{M}_{2}$. Using condition (4) in Definition 6.1 we may assume that $\mathcal{M}_{1}$ is finitely generated. Then using condition (5) in Definition 6.1 we may assume that $\mathcal{M}_{2}$ is also finitely generated. Note that from conditions (1), (3) and (6) of Definition 6.1 we know that $\operatorname{rk}\left(\mathrm{id}_{\mathcal{M}}\right), \mathrm{rk}^{\prime}\left(\mathrm{id}_{\mathcal{M}}\right)<+\infty$ for all finitely generated $R$-modules $\mathcal{M}$. Then using condition (6) in Definition 6.1 we may assume that $\mathcal{M}_{1}=\mathcal{M}_{2}$ is finitely generated and $\alpha=\operatorname{id}_{\mathfrak{N}_{2}}$. But $\operatorname{rk}\left(\mathrm{id}_{\mathcal{M}}\right)=\mathrm{rk}^{\prime}\left(\mathrm{id}_{\mathcal{M}}\right)$ for any $R$-module $\mathcal{M}$ follows from the definition of $\mathrm{rk}^{\prime}$.

From Theorem 6.2 and Lemma 3.5 we get immediately
Corollary 6.3. Let $\mathrm{rk}_{1}$ and $\mathrm{rk}_{2}$ be extended Sylvester map rank functions for $R$. If $\mathrm{rk}_{1}\left(\mathrm{id}_{\mathcal{M}}\right)=\mathrm{rk}_{2}\left(\mathrm{id}_{\mathcal{M}}\right)$ for all finitely presented $R$-modules $\mathcal{M}$, then $\mathrm{rk}_{1}=\mathrm{rk}_{2}$.

From Theorems 2.4, 3.3 and 6.2 we may identify Sylvester module rank functions, Sylvester map rank functions, Sylvester matrix rank functions, bivariant Sylvester module rank functions, and extended Sylvester map rank functions. We denote by $\mathbb{P}(R)$ the set of all Sylvester rank functions for $R$. Via treating elements of $\mathbb{P}(R)$ as Sylvester matrix rank functions equipped with the pointwise convergence topology, $\mathbb{P}(R)$ becomes a compact Hausdorff convex subset of a locally convex topological vector space.

For any maps $\alpha: \mathcal{M}_{1} \rightarrow \mathcal{M}_{2}$ and $\beta: \mathcal{M}_{2} \rightarrow \mathcal{M}_{3}$ between $R$-modules, we denote the induced map coker $(\alpha) \rightarrow \operatorname{coker}(\alpha \beta)$ by $\beta / \alpha$. From Theorems 3.4 and 6.2 we obtain

Corollary 6.4. Let rk be an extended Sylvester map rank function for $R$. For any maps $\alpha: \mathcal{M}_{1} \rightarrow \mathcal{M}_{2}$ and $\beta: \mathcal{M}_{2} \rightarrow \mathcal{M}_{3}$ between $R$-modules, we have

$$
\operatorname{rk}(\beta)=\operatorname{rk}(\alpha \beta)+\operatorname{rk}(\beta / \alpha)
$$

Remark 6.5. In [20] Bingbing Liang pointed out that the bivariant Sylvester module rank function for $R \Gamma$ in Example 3.2 can be used to define a rank for maps between $R \Gamma$-modules as in Theorem 6.2 and that this rank satisfies Corollary 6.4, though no other properties for this rank were given.

The following consequence of Proposition 5.2 strengthens condition (5) in Definition 6.1.

Corollary 6.6. Let rk be an extended Sylvester map rank function for $R$. Let $\left(\mathcal{M}_{j}, \beta_{j k}\right)$ be a direct system of $R$-modules over a directed set $J$ with direct limit $\mathcal{M}_{\infty}$. Let $\mathcal{M}$ be an $R$-module with compatible maps $\alpha_{j}: \mathcal{M} \rightarrow \mathcal{M}_{j}$ and $\alpha_{\infty}: \mathcal{M} \rightarrow \mathcal{M}_{\infty}$. Suppose that $\operatorname{rk}\left(\alpha_{i}\right)<+\infty$ for some $i \in J$. Then

$$
\operatorname{rk}\left(\alpha_{\infty}\right)=\lim _{j \rightarrow \infty} \operatorname{rk}\left(\alpha_{j}\right)=\inf _{j \in J} \operatorname{rk}\left(\alpha_{j}\right) .
$$

The reader might have noticed that condition (4) in Definition 2.3 does not appear in Definition 6.1. The next result shows that it is a consequence of the conditions in Definition 6.1.

Corollary 6.7. Let rk be an extended Sylvester map rank function for $R$. For any maps $\alpha: \mathcal{M}_{1} \rightarrow \mathcal{M}_{3}, \beta: \mathcal{M}_{2} \rightarrow \mathcal{M}_{4}$ and $\gamma: \mathcal{M}_{1} \rightarrow \mathcal{M}_{4}$ between $R$-modules, we have

$$
\operatorname{rk}\left(\left[\begin{array}{cc}
\alpha & \gamma \\
& \beta
\end{array}\right]\right) \geq \operatorname{rk}(\alpha)+\operatorname{rk}(\beta)
$$

Proof. Set $\theta=\left[\begin{array}{ll}\alpha & \gamma \\ & \beta\end{array}\right]: \mathcal{M}_{1} \oplus \mathcal{M}_{2} \rightarrow \mathcal{M}_{3} \oplus \mathcal{M}_{4}$. Denote by $\iota$ the embedding $\mathcal{M}_{2} \rightarrow \mathcal{M}_{1} \oplus \mathcal{M}_{2}$. Note that $\theta / \iota: \mathcal{M}_{1} \rightarrow \mathcal{M}_{3} \oplus\left(\mathcal{M}_{4} / \operatorname{im}(\beta)\right)$. Denote by $p$ the projection $\mathcal{M}_{3} \oplus \mathcal{M}_{4} \rightarrow \mathcal{M}_{4}$, and by $q$ the projection $\mathcal{M}_{3} \oplus\left(\mathcal{M}_{4} / \operatorname{im}(\beta)\right) \rightarrow \mathcal{M}_{3}$. Then $\iota \theta p=\beta$ and $(\theta / \iota) q=\alpha$. From the condition (2) of Definition 6.1 we have $\operatorname{rk}(\iota \theta) \geq \operatorname{rk}(\iota \theta p)=\operatorname{rk}(\beta)$ and $\operatorname{rk}(\theta / \iota) \geq \operatorname{rk}((\theta / \iota) q)=\operatorname{rk}(\alpha)$. Then from Corollary 6.4 we obtain

$$
\operatorname{rk}(\theta)=\operatorname{rk}(\iota \theta)+\operatorname{rk}(\theta / \iota) \geq \operatorname{rk}(\beta)+\operatorname{rk}(\alpha)
$$

## 7. Induced Rank Functions

In this section we discuss how one extended Sylvester map rank function for one ring induces an extended Sylvester map rank function for another ring via a bimodule.

Let $S$ be a unital ring with an extended Sylvester map rank function $\mathrm{rk}_{S}$. Let $R$ be a unital ring and let ${ }_{S} \mathcal{N}_{R}$ be an $S$ - $R$-bimodule with $0<\operatorname{rk}_{S}\left(\mathrm{id}_{\mathfrak{N}}\right)<+\infty$. For any map $\alpha: \mathcal{M}_{1} \rightarrow \mathcal{M}_{2}$ between $R$-modules, we define

$$
\begin{equation*}
f_{\mathcal{N}}^{*}\left(\mathrm{rk}_{S}\right)(\alpha):=\operatorname{rk}_{S}\left(\mathrm{id}_{\mathcal{N}} \otimes_{R} \alpha\right) / \mathrm{rk}_{S}\left(\mathrm{id}_{\mathcal{N}}\right) \tag{13}
\end{equation*}
$$

Since the tensor functor $\mathcal{N} \otimes_{R}$. preserves direct limits [27, Theorem B-7.15], using Corollary 6.6 it is easy to conclude that $f_{\mathcal{N}}^{*}\left(\mathrm{rk}_{S}\right)$ is an extended Sylvester map rank function for $R$.

Let $Q$ be a unital ring and ${ }_{R} \mathcal{W}_{Q}$ an $R$ - $Q$-bimodule. When $0<f_{\mathcal{N}}^{*}\left(\mathrm{rk}_{S}\right)\left(\mathrm{id}_{\mathcal{W}}\right)=$ $\operatorname{rk}_{S}\left(\mathrm{id}_{\mathcal{N} \otimes_{R} \mathcal{W}}\right) / \mathrm{rk}_{S}\left(\mathrm{id}_{\mathcal{N}}\right)<+\infty$, we can also define the extended Sylvester map rank functions $f_{\mathcal{W}}^{*}\left(f_{\mathcal{N}}^{*}\left(\mathrm{rk}_{S}\right)\right)$ and $f_{\mathcal{N} \otimes_{R} \mathcal{W}}^{*}\left(\mathrm{rk}_{S}\right)$ for $Q$. Clearly we have

$$
f_{\mathcal{W}}^{*}\left(f_{\mathcal{N}}^{*}\left(\mathrm{rk}_{S}\right)\right)=f_{\mathcal{N} \otimes_{R} \mathcal{W}}^{*}\left(\mathrm{rk}_{S}\right) .
$$

Next we consider a few special cases of this construction.
Let $\pi$ be a unital ring homomorphism from $R$ to $S$. Then we may apply the above construction to $S_{R}$ and every $\mathrm{rk}_{S} \in \mathbb{P}(S)$. Denoting $f_{S S_{R}}^{*}\left(\mathrm{rk}_{S}\right)$ by $\pi^{*}\left(\mathrm{rk}_{S}\right)$, we obtain a map $\pi^{*}: \mathbb{P}(S) \rightarrow \mathbb{P}(R)$. Explicitly, we have

$$
\begin{equation*}
\pi^{*}\left(\operatorname{rk}_{S}\right)(\alpha):=\operatorname{rk}_{S}\left(\mathrm{id}_{S} \otimes_{R} \alpha\right) \tag{14}
\end{equation*}
$$

for any map $\alpha: \mathcal{M}_{1} \rightarrow \mathcal{M}_{2}$ between $R$-modules. If we treat $\mathrm{rk}_{S}$ as a Sylvester matrix rank function for $S$, then clearly

$$
\begin{equation*}
\pi^{*}\left(\mathrm{rk}_{S}\right)(A)=\operatorname{rk}_{S}(\pi(A)) \tag{15}
\end{equation*}
$$

for all rectangular matrices $A$ over $R$. Thus $\pi^{*}$ is continuous and affine.
Conversely, suppose that $\mathrm{rk}_{R}$ is an extended Sylvester map rank function for $R$, and that $\pi$ is a unital ring homomorphism from $R$ to $S$ such that $0<\operatorname{rk}_{R}\left(\mathrm{id}_{S}\right)<$ $+\infty$. (A nontrivial example of this situation is given in Theorem 8.2 below.) Then we can apply the above construction to ${ }_{R} S_{S}$. In this case

$$
\begin{equation*}
f_{R S_{S}}^{*}\left(\mathrm{rk}_{R}\right)(\beta)=\mathrm{rk}_{R}(\beta) / \mathrm{rk}_{R}\left(\mathrm{id}_{S}\right) \tag{16}
\end{equation*}
$$

for all maps $\beta: \mathcal{N}_{1} \rightarrow \mathcal{N}_{2}$ between $S$-modules.
Remark 7.1. When $R$ and $S$ are Morita equivalent unital rings, given Morita equivalence bimodules ${ }_{R} \mathcal{W}_{S}$ and $S_{S} \mathcal{V}_{R}[16$, Section 18], there is a natural homeomorphism between $\mathbb{P}(R)$ and $\mathbb{P}(S)$ preserving the extremal points as follows. Note that since ${ }_{S} \mathcal{V}$ is finitely generated projective and ${ }_{S} \mathcal{V}^{n}={ }_{S} S \oplus{ }_{S} \mathcal{V}^{\prime}$ for some $n \in \mathbb{N}$ and ${ }_{S} \mathcal{V}^{\prime}$, we have $0<\operatorname{rk}_{S}\left(\mathrm{id}_{\mathcal{V}}\right)<+\infty$ for any extended Sylvester map function $\mathrm{rk}_{S}$ for $S$. Thus the map $f_{V}^{*}: \mathbb{P}(S) \rightarrow \mathbb{P}(R)$ is defined and continuous. Similarly the map $f_{\mathcal{W}}^{*}: \mathbb{P}(R) \rightarrow \mathbb{P}(S)$ is defined and continuous. Then $f_{\mathcal{W}}^{*} f_{\mathcal{V}}^{*}=f_{\mathcal{V} \otimes_{R} \mathcal{W}}^{*}=f_{S}^{*}$ is the identity map on $\mathbb{P}(S)$. Similarly, $f_{\mathcal{V}}^{*} f_{\mathcal{W}}^{*}$ is the identity map on $\mathbb{P}(R)$. Thus $f_{\mathcal{V}}^{*}$ and $f_{\mathcal{W}}^{*}$ are homeomorphisms and are inverse to each other. Let rk $\in \mathbb{P}(S)$ be non-extremal. Then $\mathrm{rk}=\lambda_{1} \mathrm{rk}_{1}+\lambda_{2} \mathrm{rk}_{2}$ for some distinct $\mathrm{rk}_{1}, \mathrm{rk}_{2} \in \mathbb{P}(S)$ and $\lambda_{1}, \lambda_{2}>0$ with $\lambda_{1}+\lambda_{2}=1$. Note that

$$
f_{\mathcal{V}}^{*}(\mathrm{rk})=\frac{\lambda_{1} \mathrm{rk}_{1}\left(\mathrm{id}_{\mathcal{V}}\right)}{\lambda_{1} \mathrm{rk}_{1}\left(\mathrm{id} \mathrm{id}_{\mathcal{V}}\right)+\lambda_{2} \mathrm{rk}_{2}\left(\mathrm{id}_{\mathcal{V}}\right)} f_{\mathcal{V}}^{*}\left(\mathrm{rk}_{1}\right)+\frac{\lambda_{2} \mathrm{rk}_{2}\left(\mathrm{id}_{\mathcal{V}}\right)}{\lambda_{1} \mathrm{rk}_{1}\left(\mathrm{id}_{\mathcal{V}}\right)+\lambda_{2} \mathrm{rk}_{2}(\mathrm{id} \mathcal{V})} f_{\mathcal{V}}^{*}\left(\mathrm{rk}_{2}\right)
$$

Thus $f_{\mathcal{V}}^{*}(\mathrm{rk})$ is not extremal.

## 8. Epimorphisms

In this section we study the map on Sylvester rank functions induced by epimorphisms.

Let $R$ and $S$ be unital rings. A unital ring homomorphism $\pi: R \rightarrow S$ is called an epimorphism if for any unital ring $Q$ and any unital ring homomorphisms $\alpha, \beta$ : $S \rightarrow Q$, if $\pi \circ \alpha=\pi \circ \beta$, then $\alpha=\beta$. For example, if $S$ is a division ring and $\operatorname{im}(\pi)$ generates $S$ as a division ring, then $\pi$ is an epimorphism. We refer the reader to [29, Section XI.1] for basic facts about epimorphisms.

Theorem 8.1. Let $\pi: R \rightarrow S$ be an epimorphism between unital rings. Let $\mathrm{rk}_{S}$ be an extended Sylvester map rank function for $S$. Denote by $\mathrm{rk}_{R}$ the extended Sylvester map rank function for $R$ defined via (14). For any map $\alpha: \mathcal{N}_{1} \rightarrow \mathcal{N}_{2}$ between $S$-modules, we have

$$
\begin{equation*}
\mathrm{rk}_{S}(\alpha)=\mathrm{rk}_{R}(\alpha) \tag{17}
\end{equation*}
$$

In particular, the map $\pi^{*}: \mathbb{P}(S) \rightarrow \mathbb{P}(R)$ defined by (14) and (15) is injective.
Proof. Since $\pi$ is an epimorphism, for any $S$-module $\mathcal{N}$, the map $S \otimes_{R} \mathcal{N} \rightarrow \mathcal{N}$ sending $a \otimes x$ to $a x$ is an isomorphism of $S$-modules [29, Proposition XI.1.2]. Thus for any map $\alpha: \mathcal{N}_{1} \rightarrow \mathcal{N}_{2}$ between $S$-modules, we have

$$
\operatorname{rk}_{S}(\alpha)=\operatorname{rk}_{S}\left(\mathrm{id}_{S} \otimes_{R} \alpha\right)=\operatorname{rk}_{R}(\alpha)
$$

The injectivity part of Theorem 8.1 answers a question of Jaikin-Zapirain [14, Question 5.10] affirmatively and was proved by him [15, Proposition 5.11] under the further assumption that $S$ is von Neumann regular, which is vital for his proof of the uniqueness of $*$-regular $R$-algebras associated with a faithful $*$-regular Sylvester matrix rank function for $R$ [15, Theorem 6.3]. Note that $S$ may not even be finitely generated as an $R$-module. Thus the formula (17) does not make sense if we stick to Sylvester map rank functions.

The following result describes the image of $\pi^{*}$ for epimorphisms $\pi$.
Theorem 8.2. Let $\pi: R \rightarrow S$ be an epimorphism between unital rings. For any extended Sylvester map rank function $\mathrm{rk}_{R}$ for $R$, the following are equivalent:
(1) $\operatorname{rk}_{R} \in \pi^{*}(\mathbb{P}(S))$.
(2) $\operatorname{rk}_{R}\left(\mathrm{id}_{S} \otimes_{R} \alpha\right)=\mathrm{rk}_{R}(\alpha)$ for any map $\alpha: \mathcal{M}_{1} \rightarrow \mathcal{M}_{2}$ between $R$-modules.
(3) $\mathrm{rk}_{R}\left(\mathrm{id}_{S} \otimes_{R} \mathrm{id}_{\mathcal{M}}\right)=\mathrm{rk}_{R}\left(\mathrm{id}_{\mathcal{M}}\right)$ for any finitely presented $R$-module $\mathcal{M}$.
(4) $\operatorname{rk}_{R}(\pi)=\operatorname{rk}_{R}\left(\mathrm{id}_{S}\right)=1$.

Proof. (1) $\Rightarrow(2)$ : Assume that $\mathrm{rk}_{R}=\pi^{*}\left(\mathrm{rk}_{S}\right)$ for some extended Sylvester map rank function $\mathrm{rk}_{S}$ for $S$. For any map $\alpha: \mathcal{M}_{1} \rightarrow \mathcal{M}_{2}$ between $R$-modules, we have

$$
\operatorname{rk}_{R}(\alpha) \stackrel{(14)}{=} \operatorname{rk}_{S}\left(\operatorname{id}_{S} \otimes_{R} \alpha\right) \stackrel{(17)}{=} \operatorname{rk}_{R}\left(\operatorname{id}_{S} \otimes_{R} \alpha\right)
$$

$(2) \Rightarrow(3)$ is trivial.
$(3) \Rightarrow(1)$ : From (3) we have $\mathrm{rk}_{R}\left(\mathrm{id}_{S}\right)=\mathrm{rk}_{R}\left(\mathrm{id}_{S} \otimes_{R} \mathrm{id}_{R}\right)=\mathrm{rk}_{R}\left(\mathrm{id}_{R}\right)=1$. Thus we have the extended Sylvester map rank function $\mathrm{rk}_{S}:=f_{R S}^{*}\left(\mathrm{rk}_{R}\right)$ for $S$ defined via (16). Then $\operatorname{rk}_{S}(\alpha)=\operatorname{rk}_{R}(\alpha)$ for all maps $\alpha$ between $S$-modules. We are left to show that $\pi^{*}\left(\mathrm{rk}_{S}\right)=\mathrm{rk}_{R}$. Set $\mathrm{rk}_{R}^{\prime}=\pi^{*}\left(\mathrm{rk}_{S}\right)$. Then (3) means $\mathrm{rk}_{R}^{\prime}\left(\mathrm{id}_{\mathcal{M}}\right)=\mathrm{rk}_{R}\left(\mathrm{id}_{\mathcal{M}}\right)$ for all finitely presented $R$-modules $\mathcal{M}$. From Corollary 6.3 we conclude that $\mathrm{rk}_{R}^{\prime}=\mathrm{rk}_{R}$.
$(2) \Rightarrow(4)$ : From (2) we have $\mathrm{rk}_{R}\left(\mathrm{id}_{S}\right)=\mathrm{rk}_{R}\left(\mathrm{id}_{S} \otimes_{R} \mathrm{id}_{R}\right)=\mathrm{rk}_{R}\left(\mathrm{id}_{R}\right)=1$. Since $\pi$ is an epimorphism, the natural $S$-bimodule map $S \otimes_{R} S \rightarrow S$ sending $a \otimes b$ to $a b$ is an isomorphism [29, Proposition XI.1.2]. Thus by (2) we have $\mathrm{rk}_{R}(\pi)=$ $\mathrm{rk}_{R}\left(\mathrm{id}_{S} \otimes_{R} \pi\right)=\mathrm{rk}_{R}\left(\mathrm{id}_{S}\right)=1$.
$(4) \Rightarrow(3)$ : For any $m \in \mathbb{N}$ we have $\operatorname{rk}_{R}\left(\mathrm{id}_{S^{m}}\right)=m \mathrm{rk}_{R}\left(\mathrm{id}_{S}\right)=m$. Let $\mathcal{M}$ be a finitely presented $R$-module. Write $\mathcal{M}$ as $\operatorname{coker}(\alpha)$ for some $n, m \in \mathbb{N}$ and some map $\alpha: R^{n} \rightarrow R^{m}$. Then $S \otimes_{R} \mathcal{M}$ is the cokernel of $\operatorname{id}_{S} \otimes_{R} \alpha: S^{n} \cong\left(S \otimes_{R} R\right)^{n} \rightarrow$ $\left(S \otimes_{R} R\right)^{m} \cong S^{m}$. Note that

$$
\operatorname{rk}_{R}\left(\operatorname{id}_{\mathcal{M}}\right)=\operatorname{rk}_{R}\left(\operatorname{id}_{R^{m}}\right)-\operatorname{rk}_{R}(\alpha)=m-\operatorname{rk}_{R}(\alpha),
$$

and

$$
\operatorname{rk}_{R}\left(\mathrm{id}_{S} \otimes_{R} \mathrm{id}_{\mathcal{M}}\right)=\mathrm{rk}_{R}\left(\mathrm{id}_{S^{m}}\right)-\operatorname{rk}_{R}\left(\operatorname{id}_{S} \otimes_{R} \alpha\right)=m-\operatorname{rk}_{R}\left(\operatorname{id}_{S} \otimes_{R} \alpha\right)
$$

Thus it suffices to show $\operatorname{rk}_{R}(\alpha)=\operatorname{rk}_{R}\left(\mathrm{id}_{S} \otimes_{R} \alpha\right)$. We have the commutative diagram

Note that $\operatorname{rk}_{R}\left(\mathrm{id}_{\operatorname{coker}(\pi)}\right)=\operatorname{rk}_{R}\left(\mathrm{id}_{S}\right)-\operatorname{rk}_{R}(\pi)=0$, and hence $\mathrm{rk}_{R}\left(\mathrm{id}_{\operatorname{coker}\left(\pi^{n}\right)}\right)=$ $n \mathrm{rk}_{R}\left(\mathrm{id}_{\text {coker }(\pi)}\right)=0$. Thus $\operatorname{rk}_{R}\left(\left(\operatorname{id}_{S} \otimes_{S} \alpha\right) / \pi^{n}\right)=0$. By Corollary 6.4 we get
$\operatorname{rk}_{R}\left(\operatorname{id}_{S} \otimes_{R} \alpha\right)=\operatorname{rk}_{R}\left(\pi^{n} \circ\left(\operatorname{id}_{S} \otimes_{R} \alpha\right)\right)+\operatorname{rk}_{R}\left(\left(\operatorname{id}_{S} \otimes_{R} \alpha\right) / \pi^{n}\right)=\operatorname{rk}_{R}\left(\pi^{n} \circ\left(\mathrm{id}_{S} \otimes_{R} \alpha\right)\right)$.
Denote by $\operatorname{dim}_{R}(\cdot \mid \cdot)$ the bivariant Sylvester module rank function for $R$ corresponding to $\mathrm{rk}_{R}$. Then $\operatorname{dim}_{R}\left(\operatorname{im}\left(\pi^{m}\right) \mid S^{m}\right)=\operatorname{rk}_{R}\left(\pi^{m}\right)=\operatorname{mrk}_{R}(\pi)=m$. We also have $\operatorname{dim}_{R}\left(\operatorname{im}\left(\pi^{m}\right) \mid S^{m}\right) \leq \operatorname{dim}_{R}\left(\operatorname{im}\left(\pi^{m}\right)\right) \leq \operatorname{dim}_{R}\left(R^{m}\right)=m$. Thus $\operatorname{dim}_{R}\left(\operatorname{im}\left(\pi^{m}\right)\right)=$ $\operatorname{dim}_{R}\left(\operatorname{im}\left(\pi^{m}\right) \mid S^{m}\right)=m$. Then

$$
\operatorname{dim}_{R}\left(\operatorname{ker}\left(\pi^{m}\right) \mid R^{m}\right)=\operatorname{dim}_{R}\left(R^{m}\right)-\operatorname{dim}_{R}\left(\operatorname{im}\left(\pi^{m}\right)\right)=m-m=0
$$

It follows that

$$
\begin{aligned}
\mathrm{rk}_{R}\left(\alpha \circ \pi^{m}\right) & =\operatorname{dim}_{R}\left(\operatorname{im}\left(\alpha \circ \pi^{m}\right) \mid S^{m}\right) \\
& =\operatorname{dim}_{R}\left(\operatorname{im}\left(\alpha \circ \pi^{m}\right) \mid \operatorname{im}\left(\pi^{m}\right)\right) \\
& =\operatorname{dim}_{R}\left(\operatorname{im}(\alpha)+\operatorname{ker}\left(\pi^{m}\right) \mid R^{m}\right)-\operatorname{dim}_{R}\left(\operatorname{ker}\left(\pi^{m}\right) \mid R^{m}\right) \\
& \geq \operatorname{dim}_{R}\left(\operatorname{im}(\alpha) \mid R^{m}\right)=\operatorname{rk}_{R}(\alpha),
\end{aligned}
$$

where the second equality is from Proposition 3.24 and the third equality is from Theorem 3.4. As $\mathrm{rk}_{R}\left(\alpha \circ \pi^{m}\right) \leq \operatorname{rk}_{R}(\alpha)$, we obtain

$$
\operatorname{rk}_{R}(\alpha)=\operatorname{rk}_{R}\left(\alpha \circ \pi^{m}\right)=\operatorname{rk}_{R}\left(\pi^{n} \circ\left(\operatorname{id}_{S} \otimes_{R} \alpha\right)\right)=\operatorname{rk}_{R}\left(\operatorname{id}_{S} \otimes_{R} \alpha\right)
$$

Let $\Sigma$ be a set of maps between finitely generated projective $R$-modules. Denote by $R_{\Sigma}$ the universal unital ring $S$ with a unital ring homomorphism $\pi: R \rightarrow S$ such that $\operatorname{id}_{S} \otimes_{R} \alpha$ is invertible as a map between $S$-modules for every $\alpha \in \Sigma$. This construction includes the universal localization of $R$ inverting a set of square matrices over $R$ as a special case, but is much more general. For example, given any unital ring homomorphisms $R \rightarrow S$ and $R \rightarrow Q$, if we denote by $S \cup_{R} Q$ the coproduct (also called the free product) of $S$ and $Q$ amalgamated over $R$, then $M_{2}\left(S \cup_{R} Q\right)$ is isomorphic to $\left(R^{\prime}\right)_{\Sigma}$ for $R^{\prime}=\left[\begin{array}{cc}S & 0 \\ Q \otimes_{R} S & Q\end{array}\right]$ and $\Sigma$ consisting of the $\operatorname{map}\left[\begin{array}{ll}0 & 0 \\ 0 & Q\end{array}\right] \rightarrow\left[\begin{array}{cc}S & 0 \\ Q \otimes_{R} S & 0\end{array}\right]$ sending $x$ to $x\left[\begin{array}{cc}0 & 0 \\ 1 \otimes 1 & 0\end{array}\right]$ for all $x \in\left[\begin{array}{cc}0 & 0 \\ 0 & Q\end{array}\right][28$, Theorem 4.10].

The universal localization $R_{\Sigma}$ was defined via generators and relations in [4], from which it is clear that $\pi: R \rightarrow R_{\Sigma}$ is an epimorphism. Malcolmson gave a more explicit description of $R_{\Sigma}$ in the case $\Sigma$ consists of endomorphisms of finitely generated free $R$-modules [23]. In fact his arguments work for general case with minor modification. Denote by $\Sigma^{\prime}$ the set of maps between finitely generated projective $R$-modules of the form

$$
\left[\begin{array}{cccc}
\alpha_{1} & \cdots & \cdots & \cdots \\
& \alpha_{2} & \cdots & \cdots \\
& & \cdots & \cdots \\
& & & \alpha_{n}
\end{array}\right]
$$

where each $\alpha_{j}$ is either in $\Sigma$, or $\mathrm{id}_{\mathcal{M}}$ for some finitely generated projective $R$-module $\mathcal{M}$ appearing as either the domain or codomain of some element in $\Sigma$, or $\mathrm{id}_{R}$. For any map $\alpha$ between $R$-modules, denote by $\operatorname{Dom}(\alpha)$ and $\operatorname{Cod}(\alpha)$ the domain and codomain of $\alpha$ respectively. Denote by $\Xi$ the set of all triples $(f, \alpha, x)$ such that $\alpha \in \Sigma^{\prime}, f$ is a map $R \rightarrow \operatorname{Cod}(\alpha)$, and $x$ is a map $\operatorname{Dom}(\alpha) \rightarrow R$. Note that $\operatorname{id}_{R_{\Sigma}} \otimes_{R} \alpha$ is invertible as a map between $R_{\Sigma}$-modules for every $\alpha \in \Sigma^{\prime}$.

Theorem 8.3 ([23]). Every element of $R_{\Sigma}=\operatorname{End}_{R_{\Sigma}}\left(R_{\Sigma} \otimes_{R} R\right)$ is of the form $\left(\mathrm{id}_{R_{\Sigma}} \otimes_{R} f\right)\left(\mathrm{id}_{R_{\Sigma}} \otimes_{R} \alpha\right)^{-1}\left(\mathrm{id}_{R_{\Sigma}} \otimes_{R} x\right)$ for some $(f, \alpha, x) \in \Xi$. Furthermore, for any $(g, \beta, y) \in \Xi,\left(\mathrm{id}_{R_{\Sigma}} \otimes_{R} f\right)\left(\mathrm{id}_{R_{\Sigma}} \otimes_{R} \alpha\right)^{-1}\left(\mathrm{id}_{R_{\Sigma}} \otimes_{R} x\right)=\left(\mathrm{id}_{R_{\Sigma}} \otimes_{R} g\right)\left(\mathrm{id}_{R_{\Sigma}} \otimes_{R} \beta\right)^{-1}\left(\mathrm{id}_{R_{\Sigma}} \otimes_{R}\right.$
y) if and only if one has

$$
\left[\begin{array}{cccc|c}
\alpha & 0 & 0 & 0 & x \\
0 & \beta & 0 & 0 & -y \\
0 & 0 & \gamma & 0 & 0 \\
0 & 0 & 0 & \theta & w \\
\hline f & g & h & 0 & 0
\end{array}\right]=\left[\frac{\zeta}{u}\right][\eta \mid v]
$$

for some $\gamma, \theta, \zeta, \eta \in \Sigma^{\prime}$ and some maps $h: R \rightarrow \operatorname{Cod}(\gamma), w: \operatorname{Dom}(\theta) \rightarrow R, u: R \rightarrow$ $\operatorname{Cod}(\zeta), v: \operatorname{Dom}(\eta) \rightarrow R$.

The following result is [28, Theorem 7.4]. Here we use Theorem 8.2 to give a new proof.
Theorem 8.4. Let $\mathrm{rk} \in \mathbb{P}(R)$ such that $\mathrm{rk}(\alpha)=\operatorname{rk}\left(\mathrm{id}_{\operatorname{Dom}(\alpha)}\right)=\operatorname{rk}\left(\mathrm{id}_{\operatorname{Cod}(\alpha)}\right)$ for every $\alpha \in \Sigma$. Then $R_{\Sigma}$ is nonzero and $\operatorname{rk} \in \pi^{*}\left(\mathbb{P}\left(R_{\Sigma}\right)\right)$.

Fix $\mathrm{rk} \in \mathbb{P}(R)$ such that

$$
\begin{equation*}
\operatorname{rk}(\alpha)=\operatorname{rk}\left(\operatorname{id}_{\operatorname{Dom}(\alpha)}\right)=\operatorname{rk}\left(\operatorname{id}_{\operatorname{Cod}(\alpha)}\right) \tag{18}
\end{equation*}
$$

for all $\alpha \in \Sigma$. Then clearly (18) holds for all $\alpha \in \Sigma^{\prime}$.
Lemma 8.5. For any map $\left[\begin{array}{ll}\alpha & \gamma \\ 0 & \beta\end{array}\right]$ between $R$-modules, if $\alpha \in \Sigma^{\prime}$ or $\beta \in \Sigma^{\prime}$, then

$$
\operatorname{rk}\left(\left[\begin{array}{cc}
\alpha & \gamma \\
0 & \beta
\end{array}\right]\right)=\operatorname{rk}(\alpha)+\operatorname{rk}(\beta)
$$

Proof. By Corollary 6.7 we have $\operatorname{rk}\left(\left[\begin{array}{cc}\alpha & \gamma \\ 0 & \beta\end{array}\right]\right) \geq \operatorname{rk}(\alpha)+\operatorname{rk}(\beta)$. When $\alpha \in \Sigma^{\prime}$, from $\left[\begin{array}{cc}\alpha & \gamma \\ 0 & \beta\end{array}\right]=\left[\begin{array}{cc}\operatorname{id}_{\operatorname{Dom}(\alpha)} & 0 \\ 0 & \beta\end{array}\right]\left[\begin{array}{cc}\alpha & \gamma \\ 0 & \operatorname{id}_{\operatorname{Cod}(\beta)}\end{array}\right]$ we get

$$
\operatorname{rk}\left(\left[\begin{array}{cc}
\alpha & \gamma \\
0 & \beta
\end{array}\right]\right) \leq \operatorname{rk}\left(\left[\begin{array}{cc}
\operatorname{id} \\
\operatorname{Dom}(\alpha) & 0 \\
0 & \beta
\end{array}\right]\right)=\operatorname{rk}\left(\operatorname{id}_{\operatorname{Dom}(\alpha)}\right)+\operatorname{rk}(\beta)=\operatorname{rk}(\alpha)+\operatorname{rk}(\beta) .
$$

When $\beta \in \Sigma^{\prime}$, from $\left[\begin{array}{cc}\alpha & \gamma \\ 0 & \beta\end{array}\right]=\left[\begin{array}{cc}\operatorname{id}_{\operatorname{Dom}(\alpha)} & \gamma \\ 0 & \beta\end{array}\right]\left[\begin{array}{cc}\alpha & 0 \\ 0 & \operatorname{id}_{\operatorname{Cod}(\beta)}\end{array}\right]$ we get

$$
\operatorname{rk}\left(\left[\begin{array}{cc}
\alpha & \gamma \\
0 & \beta
\end{array}\right]\right) \leq \operatorname{rk}\left(\left[\begin{array}{cc}
\alpha & 0 \\
0 & \operatorname{id}_{\operatorname{Cod}(\beta)}
\end{array}\right]\right)=\operatorname{rk}(\alpha)+\operatorname{rk}\left(\operatorname{id}_{\operatorname{Cod}(\beta)}\right)=\operatorname{rk}(\alpha)+\operatorname{rk}(\beta)
$$

Therefore $\operatorname{rk}\left(\left[\begin{array}{cc}\alpha & \gamma \\ 0 & \beta\end{array}\right]\right)=\operatorname{rk}(\alpha)+\operatorname{rk}(\beta)$.
Lemma 8.6. Let $(f, \alpha, x) \in \Xi$ with $\left(\operatorname{id}_{R_{\Sigma}} \otimes_{R} f\right)\left(\mathrm{id}_{R_{\Sigma}} \otimes_{R} \alpha\right)^{-1}\left(\mathrm{id}_{R_{\Sigma}} \otimes_{R} x\right)=0$. Then $\operatorname{rk}\left(\left[\begin{array}{ll}\alpha & x \\ f & 0\end{array}\right]\right)=\operatorname{rk}(\alpha)$.

Proof. Since $\alpha$ is a composition of $\left[\begin{array}{ll}\alpha & x \\ f & 0\end{array}\right]$ and some other maps, we have $\operatorname{rk}\left(\left[\begin{array}{ll}\alpha & x \\ f & 0\end{array}\right]\right) \geq$ rk $(\alpha)$. By Theorem 8.3 we have

$$
\left[\begin{array}{cccc|c}
\alpha & 0 & 0 & 0 & x \\
0 & \operatorname{id}_{R} & 0 & 0 & 0 \\
0 & 0 & \gamma & 0 & 0 \\
0 & 0 & 0 & \theta & w \\
\hline f & 0 & h & 0 & 0
\end{array}\right]=\left[\frac{\zeta}{u}\right][\eta \mid v]
$$

for some $\gamma, \theta, \zeta, \eta \in \Sigma^{\prime}$ and some maps $h: R \rightarrow \operatorname{Cod}(\gamma), w: \operatorname{Dom}(\theta) \rightarrow R, u: R \rightarrow$ $\operatorname{Cod}(\zeta), v: \operatorname{Dom}(\eta) \rightarrow R$. From Lemma 8.5 we have

$$
\operatorname{rk}(\text { LHS })=\operatorname{rk}\left(\left[\begin{array}{cc}
\alpha & x \\
f & 0
\end{array}\right]\right)+\operatorname{rk}\left(\operatorname{id}_{R}\right)+\operatorname{rk}(\gamma)+\operatorname{rk}(\theta)
$$

Note that

$$
\begin{aligned}
\operatorname{rk}(\mathrm{RHS}) & \leq \operatorname{rk}\left(\left[\begin{array}{c}
\zeta \\
u
\end{array}\right]\right) \leq \operatorname{rk}\left(\operatorname{id}_{\operatorname{Cod}(\zeta)}\right)=\operatorname{rk}\left(\operatorname{id}_{\operatorname{Dom}(\zeta)}\right) \\
& =\operatorname{rk}\left(\operatorname{id}_{\operatorname{Dom}(\alpha)}\right)+\operatorname{rk}\left(\operatorname{id}_{R}\right)+\operatorname{rk}\left(\operatorname{id}_{\operatorname{Dom}(\gamma)}\right)+\operatorname{rk}\left(\operatorname{id}_{\operatorname{Dom}(\theta)}\right) \\
& =\operatorname{rk}(\alpha)+\operatorname{rk}\left(\operatorname{id}_{R}\right)+\operatorname{rk}(\gamma)+\operatorname{rk}(\theta) .
\end{aligned}
$$

Since $\operatorname{rk}($ LHS $)=\operatorname{rk}($ RHS $)$, we get $\operatorname{rk}\left(\left[\begin{array}{cc}\alpha & x \\ f & 0\end{array}\right]\right) \leq \operatorname{rk}(\alpha)$. This finishes the proof.
We are ready to prove Theorem 8.4.
Proof of Theorem 8.4. Note that $\left(\operatorname{id}_{R}, \operatorname{id}_{R}, \operatorname{id}_{R}\right) \in \Xi$. Since $\operatorname{rk}\left(\left[\begin{array}{cc}\operatorname{id}_{R} & \operatorname{id}_{R} \\ \operatorname{id}_{R} & 0\end{array}\right]\right)=2>$ $\operatorname{rk}\left(\mathrm{id}_{R}\right)$, from Lemma 8.6 we have $1_{R_{\Sigma}} \neq 0$. Thus $R_{\Sigma}$ is nonzero.

By Theorem 8.2 we just need to show $\operatorname{rk}(\pi)=\operatorname{rk}\left(\operatorname{id}_{R_{\Sigma}}\right)=1$. Since $\operatorname{rk}(\pi) \leq$ $\operatorname{rk}\left(\operatorname{id}_{R_{\Sigma}}\right)$, it suffices to show $\operatorname{rk}(\pi) \geq 1$ and $\operatorname{rk}\left(\operatorname{id}_{R_{\Sigma}}\right) \leq 1$. Denote by $\operatorname{dim}(\cdot \mid \cdot)$ the bivariant Sylvester module rank function for $R$ corresponding to rk.

Let $\mathcal{M}$ be a finitely generated $R$-submodule of $R_{\Sigma}$. Say, $\mathcal{M}$ is generated by $\left(\mathrm{id}_{R_{\Sigma}} \otimes_{R}\right.$ $\left.f_{j}\right)\left(\mathrm{id}_{R_{\Sigma}} \otimes_{R} \alpha_{j}\right)^{-1}\left(\mathrm{id}_{R_{\Sigma}} \otimes_{R} x_{j}\right)$ with $\left(f_{j}, \alpha_{j}, x_{j}\right) \in \Xi$ for $j=1, \ldots, n$. Set

$$
\theta=\left[\begin{array}{llll}
\alpha_{1} & & & \\
& \alpha_{2} & & \\
& & \ddots & \\
& & & \alpha_{n}
\end{array}\right] \in \Sigma^{\prime}, \quad \beta=\left[\begin{array}{ll}
\theta & \\
& \operatorname{id}_{R}
\end{array}\right] \in \Sigma^{\prime}
$$

and

$$
z=\left[\begin{array}{c}
x_{1} \\
x_{2} \\
\vdots \\
x_{n}
\end{array}\right]: \operatorname{Dom}(\theta) \rightarrow R, \quad y=\left[\begin{array}{c}
z \\
\operatorname{id}_{R}
\end{array}\right]: \operatorname{Dom}(\beta) \rightarrow R
$$

Note that we may identity $\mathcal{N}^{\prime}$ with $\operatorname{Hom}_{R}\left(R, \mathcal{M}^{\prime}\right)$ for any $R$-module $\mathcal{M}^{\prime}$. Consider the $R$-module map $\gamma: \operatorname{Cod}(\beta) \rightarrow R_{\Sigma}$ sending $g$ to $\left(\operatorname{id}_{R_{\Sigma}} \otimes_{R} g\right)\left(\mathrm{id}_{R_{\Sigma}} \otimes_{R} \beta\right)^{-1}\left(\mathrm{id}_{R_{\Sigma}} \otimes_{R} y\right)$. Then $\operatorname{im}(\gamma)$ is a finitely generated $R$-submodule of $R_{\Sigma}$ containing $\mathcal{M}+\operatorname{im}(\pi)$.

We claim that $\operatorname{dim}(\operatorname{ker}(\gamma) \mid \operatorname{Cod}(\beta))=\operatorname{rk}(\theta)$. Let $\mathcal{M}{ }^{\sharp}$ be a finitely generated $R$ submodule of $\operatorname{ker}(\gamma)$. Say, $\mathcal{M}^{\sharp}$ is generated by $g_{j} \in \operatorname{ker}(\gamma)$ for $j=1, \ldots, m$. For each $1 \leq j \leq m$, by Lemma 8.6 we have

$$
\operatorname{dim}\left(\left.\operatorname{im}\left(\left[\begin{array}{cc}
\beta & y \\
g_{j} & 0
\end{array}\right]\right) \right\rvert\, \operatorname{Cod}(\beta) \oplus R\right)=\operatorname{rk}\left(\left[\begin{array}{cc}
\beta & y \\
g_{j} & 0
\end{array}\right]\right)=\operatorname{rk}(\beta)
$$

For any $1 \leq k<m$, note that

$$
\begin{aligned}
\operatorname{dim}\left(\left.\left(\sum_{j=1}^{k} \operatorname{im}\left(\left[\begin{array}{cc}
\beta & y \\
g_{j} & 0
\end{array}\right]\right)\right) \cap \operatorname{im}\left(\left[\begin{array}{cc}
\beta & y \\
g_{k+1} & 0
\end{array}\right]\right) \right\rvert\, \operatorname{Cod}(\beta) \oplus R\right) & \geq \operatorname{dim}\left(\left.\operatorname{im}\left(\left[\begin{array}{ll}
\beta & y
\end{array}\right]\right) \right\rvert\, \operatorname{Cod}(\beta) \oplus R\right) \\
& =\operatorname{rk}\left(\left[\begin{array}{ll}
\beta & y
\end{array}\right]\right) \geq \operatorname{rk}(\beta) .
\end{aligned}
$$

Then from Proposition 3.19 we get

$$
\operatorname{dim}\left(\left.\sum_{j=1}^{k+1} \operatorname{im}\left(\left[\begin{array}{ll}
\beta & y \\
g_{j} & 0
\end{array}\right]\right) \right\rvert\, \operatorname{Cod}(\beta) \oplus R\right) \leq \operatorname{dim}\left(\left.\sum_{j=1}^{k} \operatorname{im}\left(\left[\begin{array}{cc}
\beta & y \\
g_{j} & 0
\end{array}\right]\right) \right\rvert\, \operatorname{Cod}(\beta) \oplus R\right) .
$$

It follows that

$$
\operatorname{dim}\left(\left.\sum_{j=1}^{m} \operatorname{im}\left(\left[\begin{array}{cc}
\beta & y \\
g_{j} & 0
\end{array}\right]\right) \right\rvert\, \operatorname{Cod}(\beta) \oplus R\right) \leq \operatorname{rk}(\beta)
$$

Denote by $\zeta$ the quotient map $\operatorname{Cod}(\beta) \oplus R \rightarrow(\operatorname{Cod}(\beta) \oplus R) / \mathcal{M}^{\sharp}$, and by $\eta$ the projection $\operatorname{Cod}(\beta) \oplus R \rightarrow R$. Then $\eta$ factors through $\zeta$. Consider $(1,1) \in R \oplus R \subseteq$ $\operatorname{Cod}(\theta) \oplus R \oplus R=\operatorname{Cod}(\beta) \oplus R$. Note that $\sum_{j=1}^{m} \operatorname{im}\left(\left[\begin{array}{cc}\beta & y \\ g_{j} & 0\end{array}\right]\right) \supseteq \mathcal{M}^{\sharp}+R(1,1)$. Now we get

$$
\begin{aligned}
\operatorname{rk}(\theta)+1 & =\operatorname{rk}(\beta) \\
& \geq \operatorname{dim}\left(\left.\sum_{j=1}^{m} \operatorname{im}\left(\left[\begin{array}{cc}
\beta & y \\
g_{j} & 0
\end{array}\right]\right) \right\rvert\, \operatorname{Cod}(\beta) \oplus R\right) \\
& \geq \operatorname{dim}\left(\mathcal{N}^{\sharp}+R(1,1) \mid \operatorname{Cod}(\beta) \oplus R\right) \\
& =\operatorname{dim}\left(\mathcal{M}^{\sharp} \mid \operatorname{Cod}(\beta) \oplus R\right)+\operatorname{dim}((R(1,1)) \zeta \mid \operatorname{im}(\zeta)) \\
& \geq \operatorname{dim}\left(\mathcal{N}^{\sharp} \mid \operatorname{Cod}(\beta) \oplus R\right)+\operatorname{dim}((R(1,1)) \eta \mid \operatorname{im}(\eta)) \\
& =\operatorname{dim}\left(\mathcal{M}^{\sharp} \mid \operatorname{Cod}(\beta)\right)+\operatorname{dim}(R \mid R) \\
& =\operatorname{dim}\left(\mathcal{M}^{\sharp} \mid \operatorname{Cod}(\beta)\right)+1,
\end{aligned}
$$

where in the second equality we apply Theorem 3.4 and in the last inequality we apply Proposition 3.20. Therefore $\operatorname{dim}\left(\mathcal{M}^{\sharp} \mid \operatorname{Cod}(\beta)\right) \leq \operatorname{rk}(\theta)$. Taking supremum over $\mathcal{N}^{\sharp}$ we get $\operatorname{dim}(\operatorname{ker}(\gamma) \mid \operatorname{Cod}(\beta)) \leq \operatorname{rk}(\theta)$. Consider the map $\left[\begin{array}{ll}\theta & -z\end{array}\right]: \operatorname{Dom}(\theta) \rightarrow$
$\operatorname{Cod}(\theta) \oplus R=\operatorname{Cod}(\beta)$. Clearly $\left[\begin{array}{ll}\theta & -z\end{array}\right] \gamma=0$, and hence $\operatorname{im}\left(\left[\begin{array}{ll}\theta & -z\end{array}\right]\right) \subseteq \operatorname{ker}(\gamma)$. Thus

$$
\operatorname{dim}(\operatorname{ker}(\gamma) \mid \operatorname{Cod}(\beta)) \geq \operatorname{dim}\left(\left.\operatorname{im}\left(\left[\begin{array}{ll}
\theta & -z
\end{array}\right]\right) \right\rvert\, \operatorname{Cod}(\beta)\right)=\operatorname{rk}\left(\left[\begin{array}{ll}
\theta & -z
\end{array}\right]\right) \geq \operatorname{rk}(\theta) .
$$

This proves our claim.
Now we have

$$
\begin{aligned}
\operatorname{dim}(\operatorname{ker}(\gamma)+R \mid \operatorname{Cod}(\beta)) & \geq \operatorname{dim}\left(\left.\operatorname{im}\left(\left[\begin{array}{ll}
\theta & -z
\end{array}\right]\right)+R \right\rvert\, \operatorname{Cod}(\beta)\right) \\
& =\operatorname{dim}\left(\left.\operatorname{im}\left(\left[\begin{array}{rr}
\theta & -z \\
\mathrm{id}_{R}
\end{array}\right]\right) \right\rvert\, \operatorname{Cod}(\beta)\right) \\
& =\operatorname{rk}\left(\left[\begin{array}{rr}
\theta & -z \\
\operatorname{id}_{R}
\end{array}\right]\right)=\operatorname{rk}(\theta)+1 .
\end{aligned}
$$

By Theorem 3.4 we have

$$
\begin{aligned}
\operatorname{dim}(\operatorname{im}(\pi) \mid \mathcal{M}+\operatorname{im}(\pi)) & \geq \operatorname{dim}(\operatorname{im}(\pi) \mid \operatorname{im}(\gamma)) \\
& =\operatorname{dim}(\operatorname{ker}(\gamma)+R \mid \operatorname{Cod}(\beta))-\operatorname{dim}(\operatorname{ker}(\gamma) \mid \operatorname{Cod}(\beta)) \\
& \geq(\operatorname{rk}(\theta)+1)-\operatorname{rk}(\theta)=1
\end{aligned}
$$

Taking infimum over $\mathcal{M}$, we obtain $\operatorname{rk}(\pi)=\operatorname{dim}\left(\operatorname{im}(\pi) \mid R_{\Sigma}\right) \geq 1$.
We also have

$$
\begin{aligned}
\operatorname{dim}\left(\mathcal{M} \mid R_{\Sigma}\right) & \leq \operatorname{dim}\left(\operatorname{im}(\gamma) \mid R_{\Sigma}\right) \leq \operatorname{dim}(\operatorname{im}(\gamma)) \\
& =\operatorname{dim}(\operatorname{Cod}(\beta))-\operatorname{dim}(\operatorname{ker}(\gamma) \mid \operatorname{Cod}(\beta)) \\
& =\operatorname{rk}(\beta)-\operatorname{rk}(\theta)=1
\end{aligned}
$$

Taking supremum over $\mathcal{M}$, we obtain $\operatorname{rk}\left(\operatorname{id}_{R_{\Sigma}}\right)=\operatorname{dim}\left(R_{\Sigma}\right) \leq 1$ as desired.
